# 1. INTRODUCTION

The Stornophone 6000 Personality Program for software package EF is a software tool for field programming.

The program package consists of one 5 1/4" disk with the files:

|           |      |
|-----------|------|
| EF        | .BAT |
| EFR5S     | .EXE |
| HELP      | .DAT |
| DATA IO   | .EXE |
| DATA XFER | .EXE |

All files must be present on the disk or installed in the same hard disk directory when the program is executed.

## 1.1. HARDWARE AND SOFTWARE REQUIREMENTS

- a) IBM compatible PC-XT.
- b) One 5 1/4" floppy disk drive for double sided/double density disks, two are recommended.
- c) 640 KB of memory.
- d) 80 column monitor, colour or monochrome.
- e) Asynchronous Communication adapter configured as COM1.
- f) Disk Operating system, DOS 2.11 or higher.
- g) Programmer (Data I/O 19/22 or PATSI).
- h) RS232 interface cable.

## INTRODUCTION

The communication adaptor on the back of the CPU must be connected to the RS232 connector on the back of the programmer or PATSI using the RS232 cable. Both the computer and the programmer are connected to 220 V AC.

### 1.3. SOFTWARE INSTALLATION

Before using the Stornophone 6000 Personality program, copy the files on the original disk to a work disk. To do this insert your DOS disk in drive A: and turn the computer on.

When the prompt symbol A> is displayed type the DISKCOPY A: B: <CR> command to make a work disk and when prompted insert your original Stornophone 6000 disk in drive A: as your source disk and a blank disk in drive B: as your destination disk. The system will automatically format the work disk while copying the files. When the copy is ready label it properly and store your original master disk in a safe place.

Insert your work disk in drive A: and make sure that you are locked on to drive A. You should see the A> prompt; if not type A: <CR> and when the A> prompt is displayed type: EF <CR> and the program is loaded and executed.

## 2. EF SOFTWARE SPECIFICATION

### 2.1. GENERAL

The Stornophone 6000 software consists of a main program stored in a Read Only Memory (ROM) and Personality data stored in a Personality ROM which may be either a Programmable Read Only Memory (PROM) or an Electrically Erasable PROM (EEPROM)

The address range of the complete memory is 0000<sub>H</sub> - CFFF<sub>H</sub> and the personality data are located in the area C000<sub>H</sub> - C7FF<sub>H</sub>.

### 2.2. PERSONALITY PROM STRUCTURE

In order to arrange the personality data in a logically form the personality PROM (2KB) is divided into 8 pages of 256 bytes and each page used to store different kinds of data.

- Page 0 is used for Radio environment data, general data and pointers.
- Page 1-4 are used for channel data and synthesizer frequency codes.
- Page 5 is used for tone signalling telegrams.
- Page 6 is used for tone telegram lists.
- Page 7 is used for action descriptors, tables and miscellaneous data.

### 2.3. PERSONALITY DATA

The data describing the personality of a radio is called the software nomenclature and consists of mnemonics which may be either functions or subfunctions.

## EF SOFTWARE SPECIFICATION

A function is a mnemonic which states that a specific software function is wanted and some of these functions may, if selected, be further described in details by one or more subfunctions.

### 2.3.1. DEFAULT PERSONALITY DATA

All functions and subfunctions, except for channel frequencies have been given a default value which are automatically selected by the program unless the computer operator enters a different option.

### 2.3.2. PERSONALITY DATA STORAGE

Personality prompts calculated by the PC-XT personality program may be saved on a disk and later loaded again. The data set may then be altered to create a new personality prompt which can be saved and hence build a library of personality data.

## 2.4. PERSONALITY PROGRAM STRUCTURE

The Stornophone 6000 EF personality program is divided into screen pages and menus. The SETUP page is used to give general information of time and computer environment.

### 2.4.1-2.4.1. THE MAIN MENU

The main menu lists the options of programming facilities.

(E)nter data is used to create a completely new personality prompt either using default data or data loaded from a file in the library.

(D)isk I/O is used to perform data saving or loading.

(C)ode plug is the programming routines provided for code plugs.

(S)et up returns to the setup page.

(T)ransfer is used to invoke the routines for data transfer to the programming equipment.

(Q)uit exits the EF personality program.

#### 2.4.2. COMMENTS PAGE

The comments page may be used to include information about the personality prom, f.ex. customer, radio system, operator or any other comments. These text lines are stored in the order data file and later used to identify the job.

#### 2.4.3. GENERAL PAGE

The general page is used to input the radio type and the type of control box. This information defines the radio hardware and the structured options which may be found on the type label. The page also requests input of software nomenclature describing how the hardware should look like to the operator, f.ex. display configuration, timers and acoustical signals, volume levels and input/output lines.

#### 2.4.4. CHANNEL PAGE

The channel page is used to input frequencies for each channel and other channel related options.

A maximum of 99 channels may be specified and when one screen is full the program automatically advances to a new screen. Channels may be entered in any order and need not be sorted.

## EF SOFTWARE SPECIFICATION

### 2.4.5. SYSTEM PERSONALITY SETUP PAGES

A Stornophone 6000 radio may contain up to 4 system personality setups (SPS = ) and for each used the corresponding 3 pages must be filled. The first of the SPS pages is used to define the general tone signalling concept for the setup, the second page defines all encoder telegrams and their related functions, and the third SPS page defines all tone decoder telegrams.

### 2.5. DATA SAVING

When the personality data are ready they may be saved on the disk using the path as entered on the setup page. The complete software nomenclature may be saved as order data and the operator is requested to input a file name. The program automatically appends the extension .dta.

The program then calculates the prom data and the prom data may be saved. The operator is requested to input a file name (default = temp) and the program automatically appends the extension .OBJ. This file may later be accessed by the data transfer routines.

### 2.6. DISK IN/OUT

The disk in/out routines comprises:

- (R)ead order data file
- (W)rite order data file
- (G)et prom data file
- (P)ut prom data file

Each routine requires input of the file name to be read or written.

## 2.7. LISTINGS

The program provides a selection of listings, either on the screen or on a printer connected to the computer's printer port.

The operator has the option to list both the order data (software nomenclature) and the contents of the personality prom (prom data).

## 2.8. CODE PLUG PROGRAMMING

The code plug options allow the operator to enter the code plug nomenclature and the program then calculates the contents of the code plug. These data may then be used as input to the code plug programming facility in Patsi 3.

## 2.9. SETUP

The setup options in the main menu resets the program and restarts the execution at the setup page.

## 2.10. TRANSFER

The transfer option invokes the data transfer routines to send a data file to the programming equipment which may be either a EPROM programmer or a Patsi.

## 2.11. HELP

The F1 button has been programmed to display a short help notice when the cursor is positioned in an input field. The help notice gives a short explanation of the valid options relative to the nomenclature.

### **3. EF SOFTWARE NOMENCLATURE**

This section describes the radio software nomenclature and the code plug nomenclature.

The radio software nomenclature comprises 12 pages as follows:

- 3.1. General specifications
- 3.2. Channel specifications
- 3.3. System personality set-up
- 3.4. Code Plug

The general specifications must always be defined.

The channel specifications need to be defined for each channel in the radio and may hence be repeated up to 99 times.

The system personality set-up must be defined for each SPS used in the radio. At least 1 SPS must be defined.

The EF personality program automatically keeps track of how many system personality set-ups you have assigned to the channels and request the appropriate inputs. Optional you may define additional set-ups as long as they can be contained in the personality prom.

| TKA  | = | <input style="width: 30px; height: 20px;" type="text"/> |   |   |  |  | <input style="width: 30px; height: 20px;" type="text" value="0"/>   |
| SKA  | = | <input style="width: 30px; height: 20px;" type="text"/> |   |   |  |  | <input style="width: 30px; height: 20px;" type="text" value="0"/>   |

## EF SOFTWARE NOMENCLATURE

### 3.3.1. NUMBER OF TELEGRAMS WHEN MIXING TONE SYSTEMS:

#### 3.3.1.1. BZV to Sequential

Number of telegrams  
according to BZV:

Then number of sequential  
telegrams:

|    |    |
|----|----|
| 0  | 28 |
| 1  | 27 |
| 2  | 26 |
| 3  | 25 |
| 4  | 24 |
| 5  | 22 |
| 6  | 21 |
| 7  | 20 |
| 8  | 19 |
| 9  | 18 |
| 10 | 17 |
| 11 | 16 |
| 12 | 15 |
| 13 | 14 |
| 14 | 12 |
| 15 | 11 |
| 16 | 10 |
| 17 | 9  |
| 18 | 8  |
| 19 | 7  |
| 20 | 6  |
| 21 | 5  |
| 22 | 4  |
| 23 | 2  |
| 24 | 1  |
| 25 | 0  |

The EF personality program checks the number of bytes used to define telegrams and if exceeding the limit an error message is displayed.

EF SOFTWARE NOMENCLATURE

3.3.1.2. Sequential to BZV

Number of sequential telegrams:                      Then number of telegrams according to BZV

|    |    |
|----|----|
| 0  | 25 |
| 1  | 24 |
| 2  | 23 |
| 3  | 22 |

## SET UP PAGE

|      |                  |   |
|------|------------------|---|
| 5.   | SET UP PAGE..... | 1 |
| 5.1. | YEAR.....        | 1 |
| 5.2. | WEEK.....        | 1 |
| 5.3. | PATH.....        | 2 |
| 5.4. | IMPORTANT.....   | 2 |

## 5. SET UP PAGE

----- SETUP -----

Year and Week is stored in Personality Prom 1  
Please enter the Year! (e.g. '88') 88  
Please enter the Week! (e.g. '01') 01

Path to store data?

Example: C:\QOM6000\EFDATA

Note: If current directory (A:\) is wanted press RETURN.

The Set-up page is used to input the date and the path to the directory and subdirectory, if used, to store the data files.

### 5.1. YEAR

Syntax: (88 - 99)

Only years between 1988 and 1999 will be valid, and the program will write the year in the personality prom for documentation purposes.

## SET UP PAGE

### 5.2. WEEK

Syntax: (01 - 53)

Only weeks between 01 and 53 will be valid and the program will write the week in the personality prom for documentation purposes.

### 5.3. PATH

Syntax: {drive:}\{directory}\{subdirectory}

Default: Current drive and directory.

Enter the disk drive, directory and subdirectory, if used.

The path will be used to store data files and also to load existing data files.

### 5.4. IMPORTANT

The path must be to an existing drive and directory, otherwise an error will occur during a disk read or disk write operation.

See also Disk I/O.

## 6. ENTER DATA

The data entry function has been divided into the following pages:

- Comments page (6.2)
- General page (6.3)
- Channel pages (6.4)
- System Personality pages (see next chapters)

The data to enter are derived from the STORNOPHONE 6000 EF SOFTWARE NOMENCLATURE and the program checks all data for validity and syntax before accepting the inputs.

### 6.1. GENERAL FUNCTIONS

#### 6.1.1. DATA EDIT

When a page has been completed the operator has the option of approving the page or if not the program will return to the top of the page and allow new data to be input. When data have been type always press .

#### 6.1.2. DEFAULT VALUES

All Stornophone 6000 software nomenclature nmemonics have been assigned a default value which will be displayed when executing the program.

Pressing the  key selects the default value and advances to the next input field.

## ENTER DATA

### 6.1.3. HELP

The bottom line of the screen continuously displays the valid data for the present input field or prompts the operator if the syntax is not accepted, the data are invalid or, when a page has been completed if the page is OK.

### 6.1.4. ADDITIONAL HELP

Pressing function key F1 when the cursor is placed in an input field will open a window at the top of the screen in which additional help information for the present field is displayed.

Press {Enter} to close the help window and proceed with the data input.

If no additional help is available for a particular function the message:

"- no additional information available -"

is displayed.

### 6.1.5. ENTER DATA

When the (E)nter data function is selected the program prompts:

INPUT: use default values (Y/N)

If the response is (Y)es the program will assign the default values to each software function and subfunction.

If the response is (N)o the program prompts for a data File to be read? (without .dta).  
The default file is: Temp.

## ENTER DATA

When a file name has been entered the program reads the file, if existing, and then prompts:

Calculate prom? (Y/N)

If the response is (Y)es the program calculates the prom data and proceeds to the Comments page.

If the response is (N)o the program jumps directly to the Comments page.

### 6.2. COMMENTS PAGE

CQM6000: Software EF-R5.0    EF Field Programmer.    << Input: Comments >>

---

You may enter three lines of text to be stored in orderfile :

First comment line  
Second comment line  
Third comment line

The following line will be stored in the personality prom (max 16 char.)

Personality text

(Example: made in service)

---

ok?    (Yes/No/Menu)

## ENTER DATA

### 6.2.1. OPERATOR COMMENTS

The Comments page allow the operator to enter 3 lines of text each line being up to 80 characters long.

The input lines may be used to include any comments, e.g. the customer reference, job reference or radio system.

The text lines are appended to the order data file and if this file is later loaded the comments will be displayed.

### 6.2.2. PROM COMMENT

A text line consisting of max. 16 characters may be typed and will be stored in the personality prom. This text may later be used to identify a radio personality prom.

When the lines of operator comments have been entered the operator has the option of

OK? (Y)es = Proceed to General page

OK? (N)o = Edit text lines

OK? (M)enu = Return to Main menu.

# ENTER DATA

The CQM 6000 EF software nomenclature structure.

## ENTER DATA

### 6.3. GENERAL PAGE

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: General >>

---

ok? (Yes/No/Menu)

The General page is used to specify the **radio hardware**, the **structured hardware** options and the **serial number** of the radio for which the personality prom is being created.

Also **general software specifications** have been placed on this page.

#### 6.3.1. RADIO HARDWARE

The radio type is related to the frequency band and channel spacing, the maximum transmitter power and the type of installation.

This information can normally be found on the radio's type label.

## ENTER DATA

### 6.3.1.1. Frequency band Default = 11

CQM6xx

|         |               |
|---------|---------------|
| xx = 11 | 136 - 174 MHz |
| xx = 33 | 68 - 88 MHz   |
| xx = 66 | 403 - 470 MHz |
| xx = 77 | 174 - 225 MHz |

Note: The frequency band is related to structured options Ax and Bx which specify High or Low band, if used.

### 6.3.1.2. Channel spacing Default = 2

CQM6xy

|       |                          |
|-------|--------------------------|
| y = 2 | 25 kHz channel spacing   |
| y = 3 | 20 kHz channel spacing   |
| y = 4 | 12.5 kHz channel spacing |

### 6.3.1.3. Transmitter power Default = 25

CQM6xySww

Maximum transmitter power in watts.

Standard options are: 01, 06, 10, 15, 25

### 6.3.1.4. Installation Default = L

CQM6xySwwCi

The installation options is used to select the type of installation in which the radio is being used.

L = Local controlled mobile installation

R = Remote controlled mobile installation

P = Portable

## ENTER DATA

### 6.3.2. STRUCTURED HARWARE OPTIONS

#### 6.3.2.1. Structured option A and B                      Default = A0 B0

Structured options A and B are only mandatory if the radio type is CQM77x in which case the frequency band has been split in low band and high band.

A0 and B0 are the only valid combination for all other bands except the 174 - 210 MHz.

Structured option Ax relates to the transmitter frequency band {H/L} and Bx relates to the receiver frequency band.

AL, BL = 174 - 210 MHz

AH, BH = 190 - 225 MHz

#### 6.3.2.2. Structured option C

Structured option C0 is used when the radio has no channel guard decoder in which case software option CGD = N must be used.

Structured option CD is used if the radio has a channel guard decoder fitted in which case CGD = {group or frequency} must be selected.

#### 6.3.2.3. Structured option E                                      Default = EF

Structured option EF defines the software package and must always be EF.

#### 6.3.2.4. Structured option G                                      Default = 0

Structured option Gx defines the frequency stability of the radio.

G0 = Standard stability

GB = 5 ppm stability

GC = 2 ppm stability

## ENTER DATA

### 6.3.2.5. Structured option H Default = H0

Structured option Hx defines the type of personality prom.

H0 = No personality prom delivered

HA = EPROM (UV-prom-J707923P1)

HB = EEPROM (Electrically Erasable Prom - J708345P2)

### 6.3.3. SERIAL NUMBER Default = F8536M000001

The serial number input is programmed in the personality prom's manufacturing and service information area for documentation purposes.

#### 6.3.3.1. Syntax

The following syntax must be used:

F = Any letter (factory identification)

8 = Last digit of the year

53 = the week of the year

6 = 6000 family - mandatory - always 6

M = always = M

000001 = Serial number.

### 6.3.3.2. Control option CB60 Default = CB60

The control option defines the type of control used with the radio. The actual information may be obtained from the type label.

CB60 = Panel control (local)

CB61 = Handset control

## ENTER DATA

### 6.3.4. GENERAL SOFTWARE OPTIONS

#### 6.3.4.1. Code plug number

CNU = {0001 . . . 9999}                      Default = 0001

The code plug number must always be specified whether used or not. If code plug is not installed use the default value.

When the radio system uses the code plug option the number assigned to CNU = must be the same for both the radio and the code plug.

The radio software only accepts a code plug with a code plug number match.

#### 6.3.4.2. External IN/OUT lines

IOL = {1/2}                                      Default = 1

The 25-pin D-type connector on the rear of the radio has the following connections depending on the selected IOL = .

## ENTER DATA

| Pin | Function, IOL = 1     | Function, IOL = 2      |
|-----|-----------------------|------------------------|
| 1   | Battery +             | Battery +              |
| 2   | Battery +             | Battery +              |
| 3   | Carrying cassette     | Carrying cassette      |
| 4   | PTT button            | PTT button             |
| 5   | H-Bus service request | H-Bus service request  |
| 6   | H-Bus direction       | H-Bus direction        |
| 7   | H-Bus data in/out     | H-Bus data in/out      |
| 8   | On/Off reset          | On/Off reset           |
| 9   | + 5 Volt (Output)     | + 5 Volt (Output)      |
| 10  | RX line               | RX line                |
| 11  | Processed RX out      | Processed RX out       |
| 12  | Battery -             | Battery -              |
| 13  | Battery -             | Battery -              |
| 14  | Battery +             | Battery +              |
| 15  | Ignition switch       | Ignition switch        |
| 16  | Car radio mute        | Car radio mute         |
| 17  | Car horn relay        | Car horn relay         |
| 18  | Signal ground         | Signal ground          |
| 19  | Microphone            | Microphone             |
| 20  | Tone key (ENC)        | Emergency button (TNC) |
| 21  | Hook switch           | Hook switch            |
| 22  | TX line               | TX line                |
| 23  | Loudspeaker +         | Loudspeaker +          |
| 24  | Loudspeaker -         | Loudspeaker -          |
| 25  | Battery -             | Battery -              |

As you will see above, pin 20 on the connector has a different function if the IOL is changed. The default value is IOL = 1; IOL = 2 is used if the third encoder telegram (emergency) is needed. Below, the emergency call procedure according to the ZVEI recommendation will be explained in details.

### 6.3.4.3. Emergency calls

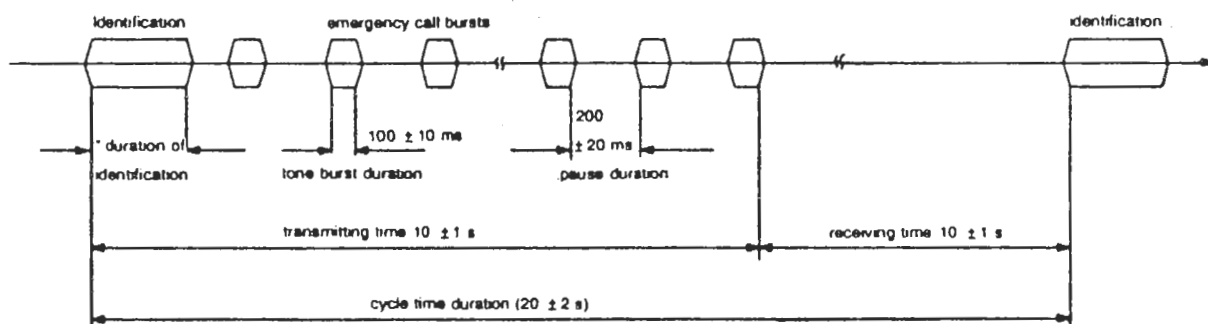

Stornophone 6000 with EF software meets the ZVEI recommendation for emergency calls. The emergency call is released by pushing an external switch connected to pin 20 on the rear connector. When the emergency button is pushed, the third encoder telegram (TNC) is transmitted. TNC must give an identification of the transmitting radio and must therefore be specified as the identity of the radio. Sequential and binary signalling as well as auxiliary telegrams may be used.

## ENTER DATA

Activation of the emergency button will not be indicated on the control box.

When the emergency button has been pushed, the radio will switch to absent mode if the on/off button is used. Switching off completely is only possible by disconnecting the radio from the power supply or by selective calling from the base.

After transmission of the TNC telegram the microphone is switched through to permit the driver to speak without having to use the push-to-talk button. The radio is switching constantly between transmission and reception every 10 seconds. During transmission, a special emergency call signal is added. This signal will be heard by anyone monitoring the channel, indicating that an emergency situation has arisen.

\* Duration of identification according to the ZVEI recommendations on transmission procedures of the five tone sequential system and the digital transmission procedures for identifications and the like

### Emergency call procedure.

#### 6.3.4.4. On/Off key disable

ODA = {0/1/2}

Default = 1

ODA = 0      The on/off key is disabled and the radio is always on if battery power is present.

ODA = 1      Normal on/off key

ODA = 2      Absent mode enabled.

## ENTER DATA

Turning the radio off when absent mode is enabled will cause the radio to be on even if turned off. Only the control box will turn off but the radio will still be on and in operation.

### 6.3.4.5. Time off timer

$\text{TIO} = \{N/10 \dots 2540\}$                       Default = N

The time off timer is used to automatically turn the radio off when the timer expires. The timer is reset every time the radio is turned on after having been off. The timer may also be reset by the ignition switch provided that cable kit CC6006 is used in the installation.

N = Time off timer disabled

Value = 10 - 2540 minutes in step of 10 minutes.

The input must be an integer.

ex.: TIO = 600 means that the radio automatically turns off 10 hours after last turn on.

See also ODA =

### 6.3.4.6. Number of channel digits

$\text{CDI} = \{0/1/2\}$                                       Default = 2

The number of channel digits should correspond with the digits used to specify CHF = .

CDI = 0              deletes the channel field in the radio display and can consequently only be used for single channel radios.

CDI = 1              can be used for radios with channel numbers 1 - 9.

CDI = 2              can be used for radios with channel numbers 01 - 99.

Note that the program automatically checks all channel numbers assigned to CHF = and program the personality prom accordingly.

## ENTER DATA

### 6.3.4.7. Group tone entry

GTE = {Y/N}

Default = N

The group tone entry function is used to allow the operator to enter group tones in the address field and hence call a group of mobiles.

GTE = N      disables the function.

GTE = Y      enables the  button to be used as group tone button and insert the group tone defined by GRP = in the address field.

When a group tone is entered the remaining positions in the telegram is automatically filled with group tones (hieracical group call).

### 6.3.4.8. CTCSS Group

CGG = {N/A/B/C}

Default = N

The Continuous Tone Carrier Squelch System (CTCSS) group defines the tone table to be used. The CTCSS signalling is according to recommendation RS220A.

If the tones are to be code plug released either CGG = A or B or C must be selected.

CGG = N      will allow CTCSS tones to be assigned to each channel using the CGE = and the CGD = functions.

Note that CTCSS tone decoding is only possible if structured option CD is available.

## ENTER DATA

Selecting CGG = {group} the number of the tone in the table {0 - D} must be assigned to CGE = and CGD = .

### 6.3.4.9. CTCSS tones according to RS220A

#### Group A (Hz):

|       |       |       |       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 67.0  | 77.0  | 88.5  | 100.0 | 107.2 | 114.8 | 123.0 | 131.8 | 141.3 | 151.4 | 162.2 |
| 0     | 1     | 2     | 3     | 4     | 5     | 6     | 7     | 8     | 9     | A     |
| 173.8 | 186.2 | 203.5 |       |       |       |       |       |       |       |       |
| B     | C     | D     |       |       |       |       |       |       |       |       |

#### Group B (Hz):

|       |       |       |       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 71.9  | 82.5  | 94.8  | 103.5 | 110.9 | 118.8 | 127.3 | 136.5 | 146.2 | 156.7 | 167.9 |
| 0     | 1     | 2     | 3     | 4     | 5     | 6     | 7     | 8     | 9     | A     |
| 179.9 | 192.8 | 210.7 |       |       |       |       |       |       |       |       |
| B     | C     | D     |       |       |       |       |       |       |       |       |

#### Group C (Hz):

|      |      |      |      |
|------|------|------|------|
| 74.4 | 79.7 | 85.4 | 91.5 |
| 0    | 1    | 2    | 3    |

See also CGD = and CGE =

### 6.3.4.10. Reduced power level

RPL = {N, 0.6 - 25}

Default: RPL = N

Reduced power level used on specified channels.

RPL = N      Reduced power level not used on any channel. Subfunction, RPL related to CHF is skipped and programmed to full power on all channels.

RPL = {value}      The value specified is not programmed in the personality prom but only used to specify the level to which the power is reduced on channels that should be operated on low power.

## ENTER DATA

Normally the power level must be specified to be not less than 10% of maximum power which means that for a 6 W radio the lowest permissible RPL = 0.6 and for a 25 W radio RPL = 2.5.

Any value between the low and high power level is valid.

### 6.3.4.11. Minimum values for reduced power level

| Nominal Value | Minimum Value in Watt for RPL at: |         |         |         |
|---------------|-----------------------------------|---------|---------|---------|
|               | 80 MHz                            | 160 MHz | 200 MHz | 450 MHz |
| 1 Watt        | 1.0                               | 0.6     | -       | 0.6     |
| 6 Watt        | 1.0                               | 0.6     | 2.5     | 0.6     |
| 10 Watt       | 1.0                               | 2.5     | 2.5     | 2.5     |
| 15 Watt       | 2.5                               | 2.5     | 2.5     | 2.5     |
| 25 Watt       | 2.5                               | 2.5     | 2.5     | 2.5     |

### 6.3.4.12. Maximum value for reduced power level

When a Stornophone 6000 is placed in a carrying cassette (Portable option), the output power is automatically reduced to the RPL value on all channels. This is done to protect the user against any harm caused by electromagnetic radiation. For this reason the value of RPL must not exceed 7 Watt.

Example:

A 160 MHz radio unit is ordered with a nominal output of 10 Watt. According to the table above, the minimum value is 2.5 Watt. In other words, RPL can be assigned a value in the range from 7 down to 2.5 Watt.

## ENTER DATA

If you enter:

```
RPL      = 3.6
          :
          :
CHF      = 01
          :
          ,PWR = Y
CHF      = 02
          :
          ,PWR = N
```

You will program the radio to transmit at a level of 3.6 Watt on channel 01, while on channel 02, the output power is 10 Watt.

If you insert this radio in a carrying cassette, the transmitter power will be 3.6 Watt on both channels.

### 6.3.4.13. Minimum volume

MIV = {0, . . . 8}

Default: MIV = 0

Minimum volume is used to program the volume control to a range of steps. The audio volume can be adjusted in 8 steps and cannot be set to steps lower than that programmed as minimum.

If minimum volume is equal to maximum volume the volume up and volume down buttons are disabled.

Legal range for minimum volume is 0, 1, 2, 3, 4, 5, 6, 7, 8 but can obviously not be programmed higher than the value specified by MAV = .

See also MAV =

## ENTER DATA

### 6.3.4.14. Maximum volume

$MAV = \{MIV \text{ TO } 8\}$

Default:  $MAV = 8$

Maximum volume is used to program the volume control to a range of steps. The volume control can be adjusted in 8 steps and cannot be set to steps higher than that programmed as maximum. If maximum volume is equal to minimum voltage the volume up and volume down buttons are disabled.

Legal range for maximum volume is from the step specified by  $MIV =$  to 8.

See also  $MAV =$

### 6.3.4.15. Default volume

$DEV = \{N/1 \dots 8\}$

Default = N

The default volume defines the volume setting when the radio is turned on.

$DEV = N$  defines the volume to be set to the value as when the radio was turned off.

$DEV = \{1 - 8\}$  defines a fixed volume to be set to the selected step every time the radio is turned on.

### 6.3.4.16. Group call volume

$CGV = \{P/MIV - MAV\}$

The group call volume defines the volume of the signal in the loudspeaker indicating that a group call has been received.

$CGV = P$  defines the volume to be the step selected by the radio operator.

$CGV = MIV - MAV$  defines a group call signal to be sounded at a fixed step as selected. Any step between the values assigned to  $MIV =$  and  $MAV =$  can be selected.

## ENTER DATA

### 6.3.4.17. Alert volume

ACA = {N/O - MAV}                      Default = 6

The alert volume defines the volume step to be used for the signal indicating that a call has been received.

ACA = N              disables the alert signal

ACA = 0 - MAV sets the volume of the call signal to the selected step  
which cannot be higher than the value assigned to MAV = .

### 6.3.4.18. Alert time

,ALT = {1 . . . 25}                      Default = 1

The alert time defines the length of the alert tone and can be specified to values between 1 and 25 seconds.

If ACA = N this function is irrelevant and skipped by the program.

### 6.3.4.19. Acoustic feed back

AFB = {Y/N}                      Default = Y

The acoustic feed back function defines whether the operator should hear a beep every time a button is depressed.

AFB = Y              enables the feed back beep

AFB = N              disables the feed back beep

## ENTER DATA

### 6.3.4.20. General page approval

When the input to the general page is finished the program prompts:

OK? {Yes/No/Menu}

Press Y to proceed to the next page.

Press N to edit the data in the general page.

Press M to return to the main menu.

## 6.4. CHANNEL PAGE

CQM6000: Software EF-R5.0      EF Field Programmer.      << Input: Channels >>

| CHF | ,TXF       | ,RXF       | ,CGE  | ,CGD  | ,PWR | ,PLG | ,SPS |
|-----|------------|------------|-------|-------|------|------|------|
| 1   | 150.000000 | 150.000000 | N     | N     | N    | N    | 0    |
| 2   | 156.000000 | 156.000000 | N     | N     | N    | N    | 1    |
| 3   | 156.025000 | 156.025000 | 100.0 | 100.0 | N    | N    | 0    |
| 4   | 156.025000 | 156.025000 | 103.5 | 103.5 | N    | N    | 1    |

N

---

ok? (Yes/No/Menu)

The channel page(s) allows up to 99 channels to be defined for a radio. When a page is full the program automatically proceeds with a clear screen.

## ENTER DATA

The channel input page consists of 8 columns for CHF = , TXF = , RXF = , CGE = , CGD = , PWR = , PLG = , and SPS =

Channels may be entered in any order and the bottom line constantly displays the valid input for the field in which the cursor is positioned.

### 6.4.1. CHANNEL NUMBER

CHF = {N/1 . . . 99}                      Default = N

All channel numbers must be defined between 1 and 99 and maximum 99 channels may be defined. The channel input routine is repeated for all channels and when the last channel has been defined specify CHF = N to leave the input procedure.

Before the program proceeds to the next page the operator must approve the channels when prompted: OK? {Yes/No/Menu}

if all channel data are correct type (Y)es to proceed.

If typing errors should be corrected type (N)o to edit the channel data. The program then begins to display data at the first channel line (CHF = ) and the assigned data may be edited by typing new data in the input field. Press  to go through the channel data lines.

Note:            Entering CHF = N when positioned in the CHF field will delete all the remaining channel lines.

## ENTER DATA

### 6.4.1.1. Transmitter frequency

.TXF = {Frequency in MHz}      Default = none

The transmitter frequency for each channel used in the radio must be specified. The frequency range depends on the radio type and will be displayed on the bottom line of the screen. Any attempt to input an out of range frequency results in an error message and the cursor being placed in the field where the error occurred.

Press  when the input field shows the correct frequency.

Note:      The frequency must be specified with up to 6 decimal digit but if the frequency is not in the correct frequency raster as defined by the radio type a warning will be displayed when the personality prom data are calculated. The program will, however, calculate data so that minimum frequency error is obtained.

### 6.4.1.2. Receiver frequency

.RXF = {Frequency in MHz}      Default = none

The receiver frequency for each channel used in the radio must be specified. The frequency range depends on the radio type and will be displayed on the bottom line of the screen. Any attempt to input an out of range frequency results in an error message and the cursor being placed in the field where the error occurred.

Pressing  without specifying a frequency will copy the transmitter frequency (TXF = ) to the RXF = field.

Press  when the input field shows the correct frequency.

## ENTER DATA

### 6.4.1.3. Selfquieting

Certain receiver frequencies may be subject to selfquieting, i.e. harmonic frequencies of internal processor signals or mixer products may result in a frequency equal to or close to the receiver frequency. The program automatically checks each receiver frequency during personality data calculation for selfquieting and, if selfquieting may occur displays a message describing the remedies to avoid the problem.

Note: The receiver frequency may be specified with up to 6 decimal digits but if the frequency is not in the correct frequency raster as defined by the radio type a warning will be displayed when the personality data are calculated.

The program will, however, calculate data so that minimum frequency error is obtained.

### 6.4.2. CHANNEL GUARD ENCODER AND DECODER

CGE = { } CGD = { } Default = N

The channel guard (CTCSS signalling) can be defined in two ways depending on the value assigned to function CGG = .

## ENTER DATA

### 6.4.2.1. CGG = {group A, B, or C}

The tone used on the channel is defined by assigning the tone number of the selected group to ,CGE = and ,CGD =

| Group A (Hz) | Group B (Hz) | Group C (Hz) | Tone number |
|--------------|--------------|--------------|-------------|
| 67.0         | 71.9         | 74.4         | 0           |
| 77.0         | 82.5         | 79.7         | 1           |
| 88.5         | 94.8         | 85.4         | 2           |
| 100.0        | 103.5        | 91.5         | 3           |
| 107.2        | 110.9        | -            | 4           |
| 114.8        | 118.8        | -            | 5           |
| 123.0        | 127.3        | -            | 6           |
| 131.8        | 136.5        | -            | 7           |
| 143.3        | 146.2        | -            | 8           |
| 151.4        | 156.7        | -            | 9           |
| 162.2        | 167.9        | -            | A           |
| 173.8        | 179.9        | -            | B           |
| 186.2        | 192.8        | -            | C           |

### 6.4.2.2. CGG = N

The tone used on the channel is specified by assigning a frequency (Hz) to the ,CGE = and the ,CGD = . The frequency must be specified with one decimal digit and a maximum of 15 different tones may be used. The program will display a warning if the number of channel guard tones exceeds the limit.

Note: Channel guard DECODER tones requires that the radio has structured option CD (decoder module) built in.

CGE = N or CGD = N defines that channel guard encoder, or decoder, is not used on the channel.

---

ok? (Yes/No/Menu)

The program automatically displays and requests input of the data related to SPS as assigned to channels.

## SYSTEM PERSONALITY SET-UP PAGE

### 7.1. SYSTEM PERSONALITY SET-UP

SPS = {Y/N}                      Default = N

|         |                   |
|---------|-------------------|
| SPS = 0 | Mandatory         |
| SPS = 1 | Extra as required |
| SPS = 2 | Extra as required |
| SPS = 3 | Extra as required |

The SPS = is continuously being displayed at the upper right screen corner.  
Type (Y)es if the SPS = 1 or 2 or 3 should be programmed.

**Queue mode** can only be specified for SPS = 0.

The program always requires that SPS = 0 is programmed.

For each SPS = the following software nomenclature must be defined.

### 7.2. ADDRESS DIGITS

ADI = {0 . . . 7}                      Default = 0

ADI = 0                      deletes the address field in the display.

ADI = 1 - 7                      adjusts the length of the address field in the display to the selected number of digits and hence only references to these digits are valid when specifying the telegrams.

Example:                      ADI = 3  
   Only references to digits 1A, 2A and 3A are valid.

## SYSTEM PERSONALITY SET-UP PAGE

### 7.3. STATUS DIGITS

SDI = {0 . . . 2}                      Default = 0

SDI = 0                      deletes the status field in the display.

SDI = 1 - 2                  adjusts the length of the status field in the display to the selected number of digits and hence only references to defined status digits are valid when specifying the telegrams.

Example:                      SDI = 1  
                                    Only references to digit 1S is valid.

### 7.4. PRIVACY

PRI = {Y/N}                      Default = N

The privacy option defines the conditions under which the loudspeaker may be opened.

PRI = Y                      defines that the loudspeaker cannot be opened manually.

PRI = N                      defines that the loudspeaker may be opened manually by depressing the  button.

### 7.5. PRIVACY BREAK DOWN TIME

,BDT = {0 . . . 254/N}              Default = 30

The privacy break down timer defines the time from disappearance of a received carrier till the loudspeaker is automatically closed.

## SYSTEM PERSONALITY SET-UP PAGE

### 7.8. PUSH-TO-TALK ADMIT CRITERIA

PTA = {0/1/2/3/N}                      Default = 0

The PTA = function defines the criteria to be associated with the PTT device.

|         |                                  |
|---------|----------------------------------|
| PTA = N | PTT totally blocked              |
| PTA = 0 | Loudspeaker open or channel free |
| PTA = 1 | Channel free                     |
| PTA = 2 | Loudspeaker open                 |
| PTA = 3 | No limitation                    |

### 7.9. TONE KEY ADMIT CRITERIA

TKA = {0/1/2/3/N}                      Default = 0

The TKA = function defines the criteria to be associated with the tone  button.

|         |                                  |
|---------|----------------------------------|
| TKA = N | Tone key totally blocked         |
| TKA = 0 | Loudspeaker open or channel free |
| TKA = 1 | Channel free                     |
| TKA = 2 | Loudspeaker open                 |
| TKA = 3 | No limitation                    |

### 7.10. SECOND TONE KEY ADMIT CRITERIA

SKA = {0/1/2/3/N}                      Default = 0

The SKA = function defines the criteria to be associated with the second tone key .

|         |                                  |
|---------|----------------------------------|
| SKA = N | Second tone key totally blocked  |
| SKA = 0 | Loudspeaker open or channel free |

## SYSTEM PERSONALITY SET-UP PAGE

|         |                  |
|---------|------------------|
| SKA = 1 | Channel free     |
| SKA = 2 | Loudspeaker open |
| SKA = 3 | No limitation    |

### 7.11. CODE PLUG NEEDED

,PLG = {Y/N}                      Default = N

The ,PLG = subfunction may be used for both PTA = , TKA = and SKA = to define that the criteria is also dependent of a proper code plug being inserted.

,PLG = N                      defines that a code plug is not needed.

,PLG = Y                      defines that the function may be operated only when a proper code plug is inserted.

### 7.12. CARRIER CONTROL TIMER

CTT = {N/1 - 254}                      Default = N

The CCT =                      function defines the maximum duration of each transmission period. Prior to a time out a warning signal will be heard.

CTT = N                      disables the carrier control timer and hence there is no limitation of a transmission period.

CTT = {1-254} sets the timer to the specified number of seconds for one period of transmission. When the timer expires a warning signal is sounded and if the operator refuses to release the PTT device the radio automatically breaks the transmission.

## SYSTEM PERSONALITY SET-UP PAGE

### 7.13. TONE SYSTEM

TON = {ZV1/ZV2/ZV3/CCI/VDE/EEA/BZV/BEE/DTM/N}     Default = N

The TON = function defines the default tone system of the radio. The selected default system must always be that used for tone decoders. For tone encoders the subfunction ,TON = may be used to assign a different tone system to be used for the particular encoder telegram. When defining the individual encoder telegrams the ,TON = S subfunction defines that the default tone system is used (S = Standard).

#### 7.13.1. SEQUENTIAL TONE SYSTEMS

TON = ZV1: ZVEI 1 Recommendation

TON = ZV2: ZVEI 2 Recommendation

TON = ZV3: ZVEI 3 Recommendation

TON = CCI: CCIR Recommendation

TON = EEA: EEA Recommendation

TON = VDE: VDEW Recommendation

#### 7.13.2. BINARY TONE SYSTEMS

TON = BZV: ZVEI Recommendation

TON = BEE: EEA Recommendation

#### 7.13.3. DUAL TONE MULTI FREQUENCY (DTMF) SYSTEM

TON = DTM

## SYSTEM PERSONALITY SET-UP PAGE

### 7.13.4. TONE SYSTEM NOT USED

TON = N which automatically skips all nomenclature input for tone signalling (open system). Other SPS = may, however, use tone signalling.

Descriptions of the specification and the nomenclature input for the different types of tone signalling are found in separate sections.

## 8. SEQUENTIAL TONE SYSTEMS

The sequential tone signalling circuitry is an integrated part of the radio hardware and hence no supplementary modules have to be fitted. All tone signalling can be defined by using the software nomenclature.

\*) Decoders only, any frequency above with the right tone length.

**Sequential tone signalling table**

**8.1.1. PREAMBLE TIME**

,PRE = {N/S/10 . . . . 2540} Default = S

The preamble time ("Wake-up time") is the time from the instant the transmitter is activated to the moment the tone telegram is transmitted.

## SEQUENTIAL TONE SYSTEMS

,PRE = S The preamble time is standard as defined by the default tone system.

,PRE = <value in milliseconds >

Non-standard preamble time defined by the radio system. The specified time (in 10 millisecond steps) will be used as default value for the individual tone telegrams if the individual ,PRE = S.

PRE = N No preamble time.

### 8.1.2. DURATION

,DUR = {S/10 . . . 2540}

The ,DUR = subfunction defines the duration of the first tone in a telegram.

,DUR = S defines all tones in the telegram to have the same duration as specified by the default tone system.

←→ ,DUR

,DUR = <value in milliseconds >

Duration of the first tone in a transmitted telegram will be equal to the defined value (in 10 millisecond steps) and will be used as default value for the individual ,DUR = S

←→ ,DUR

Only the first tone duration will be affected keeping the standard duration for the remaining tones in the telegram.

## SEQUENTIAL TONE SYSTEMS

### 8.1.3. DTMF-MODE ENABLE

,DTM = {Y/N}                      Default = N

The DTMF (Dual Tone Multi-Frequency) mode is used, and hence enabled when the radio should be operated in a radio system with private telephone exchange (PABX) interconnection.

,DTM = N    DTMF-mode disabled

,DTM = Y    DTMF-mode enabled

### 8.1.4. PAUSE

,PAU = {1 .. 15}                      Default = 3

The ,PAU = subfunction is required only if the DTM = Y and defines the time of a pause in DTMF signalling.

The pause value is stated in seconds and legal range is 1 to 15.

### 8.1.5. GROUP DIGIT

GRP = {N/O ... F}                      Default = N

When designing a group call scheme for the system, you start by assigning a group digit to GRP. e.g. GRP = A. You may assign another digit if you like, e.g. GRP = 0. If this is the case, the digit "0" is reserved for group calls and will not make sense if used for other purposes. The group digit is used both for decoding and encoding group calls.

## SEQUENTIAL TONE SYSTEMS

Next, you decide into which position in the decoder telegram ,POS = the group tone is to be inserted. For illustration, consider the three examples given below.

Example 1:

Suppose we write:

DEC = 2.4.6.8.0

GRP = A

,POS = 4

Loudspeaker will open upon receiving:

2 4 6 8 0

2 4 6 A A

Example 2:

Suppose we write:

DEC = 2.4.6.8.0

GRP = A

,POS = 3.4

Loudspeaker will open upon receiving:

2 4 6 8 0

2 4 6 A A

2 4 A A A

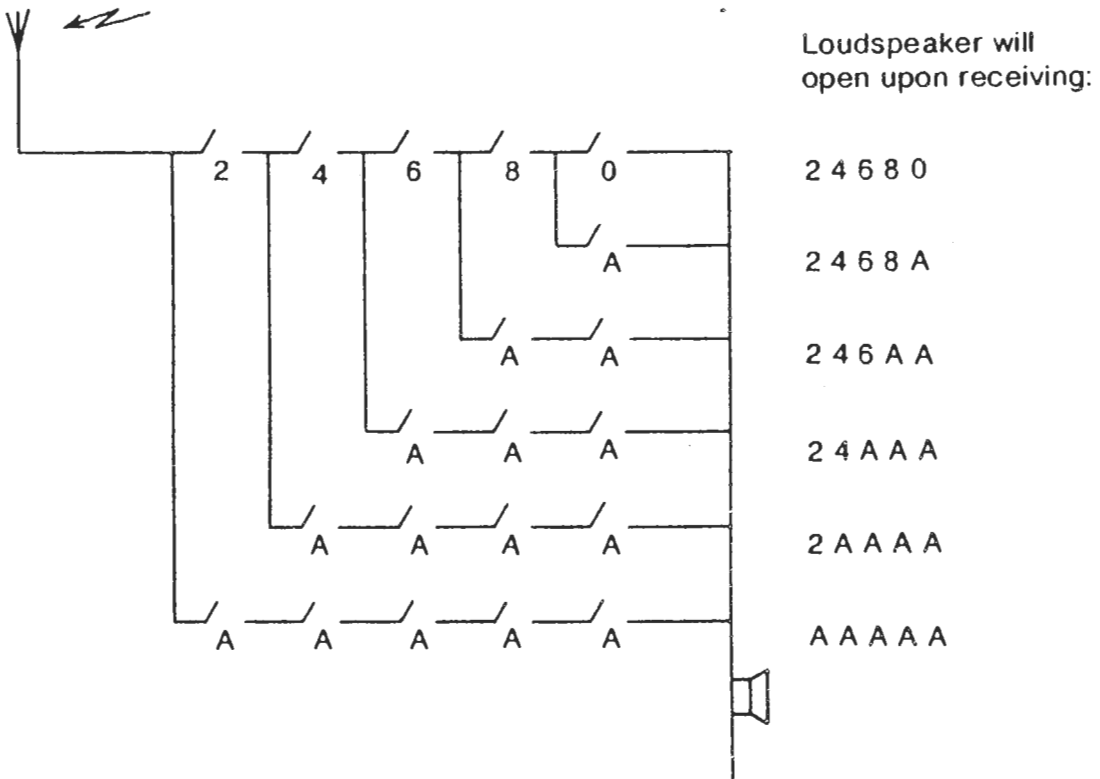

## SEQUENTIAL TONE SYSTEMS

### 8.1.6. POSITION OF GROUP DIGIT

,POS = {N/1 . . . 8}      Default = N

The ,POS = defines the positions in which the telegram decoder accepts group tones and responds accordingly.

,POS = N    Group tone accepted in all positions (hierarchical group call).

You write:

DEC            =    2.4.6.8.0  
 GRP           =    A  
 ,POS          =    N

## SEQUENTIAL TONE SYSTEMS

POS = {position(s)}

The positions of the group tone must be entered as a string of digit between 1 and 7 (without periods or spaces).

Example: Group call on position 3 and 4 and 5.

,POS = 345

### 8.1.7. BREAK DOWN TIME

,BDT = {N/0 . . . 254} Default = 3

The ,BDT = subfunction defines the break down time for a group call. The time specified is the time from carrier disappearance till loudspeaker switch off.

,BDT = N No break down, timer disabled.

,BDT = value 0 - 254 seconds, as specified, break down time.

## SEQUENTIAL TONE SYSTEMS

### 8.2. SEQUENTIAL TONE ENCODER TELEGRAMS

The Stornophone 6000 EF Software package is designed to support radio systems in which several telegrams may be used for different purposes.

The encoder telegrams are:

- ENC = 1. encoder telegram
- SNC = 2. encoder telegram
- TNC = 3. encoder telegram
- TOF = Transmit on first PTT telegram
- TOE = Transmit on every PTT telegram
- AC1 = Acknowledge telegram for decoder
- AC2 = Acknowledge telegram for parallel decoder
- AC3 = Acknowledge telegram for Clear Down decoder
- HUT = Hang-up telegram

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| Signal-Digits | (TX - Telegrams) | TON | PRE | DUR | FOL | PRE | DUR |
|---------------|------------------|-----|-----|-----|-----|-----|-----|
| ENC=1         | 2 3 4 5 N        | S   | S   | S   | TTF | S   | S   |
| SNC=5         | 4 5 6 0 N        | S   | S   | S   | TTF | S   | S   |
| TNC=6         | 0 0 0 N          | S   | S   | S   | TTF | S   | S   |
| TOF=N         |                  |     |     |     |     |     |     |
| TOE=N         |                  |     |     |     |     |     |     |
| AC1=1         | 2 3 4 5 N        | S   | S   | S   | TTF | S   | S   |
| AC2=2         | 3 4 5 6 N        | S   | S   | S   | TTF | S   | S   |
| AC3=5         | 6 7 8 0 N        | S   | S   | S   | TTF | S   | S   |
| ACT=          | 0.15             |     |     |     |     |     |     |
| HUT=1         | 2 3 4 5 N        | S   | S   | S   | TTF | S   | S   |
| BYE=N         |                  |     |     |     |     |     |     |
| STF=6         | 6 0 0 3 N        | S   | S   | S   |     |     |     |
| TTF=5         | 6 7 2 5 N        | S   | S   | S   |     |     |     |

ok? (Yes/No/Menu)

## SEQUENTIAL TONE SYSTEMS

### 8.2.1. GENERAL ENCODER SYSTEM

#### 8.2.1.1. Telegram size

All telegrams can contain up to 7 positions. If a single telegram cannot accommodate the requested information, you can append extra telegrams using the second and/or third telegram format STF = and TTF = .

#### 8.2.1.2. Telegram specification

A telegram can be defined in two ways:

a string of telegram tones which **must** be separated by  and where each position is occupied by:

either a fixed digit:

0 1 2 3 4 5 6 7 8 9 A B C D E X

or a reference to a digit in the display

1A 2A 3A 4A 5A 6A 7A 1S 2S

or a reference to a digit in the codeplug:

C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14  
C15 C16 C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Example: ENC = 1.1A.5.1S.C01

Note:

The EF Software nomenclature accepts only that 7 tones are being defined for a telegram. The EF personality program, however, allows up to 15 tones in one telegram, but this will limit the total number of telegrams in one radio.

## SEQUENTIAL TONE SYSTEMS

### 8.2.1.6. Functional telegrams

The CQM 6000 EF Software includes nine functional telegrams. Such a telegram is transmitted after one of the following actions or events:

| Action/event:  | Telegram: |
|--|-----------|
| Pushing the  button | ENC       |
| Pushing the  button | SNC       |
| Pushing the external emergency button  | TNC       |
| Pushing the PTT button with<br>loudspeaker off   | TOF       |
| Pushing the PTT button   | TOE       |
| Decoding DEC   | AC1       |
| Decoding PDE   | AC2       |
| Decoding CLD   | AC3       |
| Placing the handset in the retainer or<br>closing the loudspeaker manually                           | HUT       |

### 8.2.1.7. Third encoder (TNC) - Emergency procedure

The third encoder telegram is released from the 25 pin connector on the rear side of the radio. When it is released, the emergency procedure is carried out according to the ZVEI recommendation.

### 8.2.1.8. Auxiliary telegrams

Auxiliary telegrams are telegrams which can be appended to a functional telegram. Note that auxiliary telegrams cannot "leave the house unless accompanied by a parent", i.e. a functional telegram.

## SEQUENTIAL TONE SYSTEMS

The encoder telegram (ENC) is released when the  button is pressed and the TKA = criteria is fulfilled.

Example: ENC = 1.2.1A.2A.3A

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

-----  
Signal-Digits (TX - Telegrams) TON PRE DUR FOL PRE DUR

ENC=1 2 3 4 5 N  
↑ ↑ ↑ ↑ ↑ ↑  
|-----|

<Enter>

### 8.2.2.2. Tone system (used by ENC)

,TON = {S/system} Default = N

The ,TON = subfunction of a telegram may be used to specify another tone system than that defined as default by function TON =

,TON = S Standard default tone system

,TON = system Tone system different to default system. The options are:  
ZV1/ZV2/ZV3/CCI/EEA/VDE/BZV/BEE

## SEQUENTIAL TONE SYSTEMS

### 8.2.2.3. Preamble time (used by ENC)

,PRE = {S/N/10 . . . 2540} Default = S

The ,PRE = subfunction of a telegram may be used to specify a preamble time different to that specified by default function PRE = .

,PRE = S                    Standard preamble as defined by function PRE = .

,PRE = N                    No preamble

,PRE = <milliseconds>

User defined preamble, valid range 10 - 2540 milliseconds.

The data input must be an integer and in steps of 10 milliseconds.

### 8.2.2.4. Duration of 1. tone (used by ENC)

,DUR = {S/N/10 . . . 2540} Default = S

The ,DUR = subfunction of a telegram may be used to specify a duration of the first tone in the telegram to be different to that specified by default, function DUR = .

,DUR = S                    Standard duration as defined by function DUR = .

,DUR = N                    No duration

,DUR = <milliseconds>

User defined duration, valid range 10 - 2540 milliseconds.

The data input must be an integer and in steps of 10 milliseconds.

## SEQUENTIAL TONE SYSTEMS

### 8.2.2.5. Following telegram

,FOL = {STF/TTF/N} Default = N

All encoder telegrams may be followed by an auxiliary telegram format which must be defined by functions STF = and TTF = .

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

---

| Signal-Digits | (TX - Telegrams) | TON | PRE | DUR | FOL | PRE | DUR |
|---------------|------------------|-----|-----|-----|-----|-----|-----|
| ENC=1         | 2 3 4 5 N        | S   | S   | S   | STF |     |     |

---

Syntax: N^STF^TTF^ Default: N

The ,FOL = and the associated ,PRE = and ,DUR = subfunctions are entered on the same line as the encoder. Two telegrams (STF and TTF) may be appended to an encoder.

## SEQUENTIAL TONE SYSTEMS

The input is as follows:

```

ENC = {telegram}
      ,TON = {signalling system}
      ,PRE = {preamble}
      ,DUR = {duration}
      ,FOL = {1. following telegram (STF or TTF - N = No)}
      ,PRE = {preamble of 1. FOL = }
      ,DUR = {duration of 1. FOL = }
      ,FOL = {2. following telegram (STF or TTF - N = No)}
      ,PRE = {preamble of 2. FOL = }
      ,DUR = {duration of 2. FOL = }
    
```

First time the cursor is placed in the FOL field the first following telegram may be entered, and if FOL = N the rest of the input for this encoder is skipped. If a telegram format is entered (STF or TTF) then the associated ,PRE = and ,DUR = must be defined. The cursor then again is placed in the FOL field for new input and this time the last following telegram format may be entered. The input of a telegram format requires input of the associated PRE and DUR and FOL = N proceeds to the next encoder.

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| Signal-Digits | (TX - Telegrams) | TON | PRE | DUR | FOL | PRE | DUR |
|---------------|------------------|-----|-----|-----|-----|-----|-----|
| ENC=1         | 2 3 4 5 N        | S   | S   | S   | TTF | S   | S   |

Example:

ENC=1.2.3.4.5

```

,TON = S ,PRE = S ,DUR = S
,FOL = TTF ,PRE = S ,DUR = S
    
```

---

Syntax: N^STF^TTF^ Default: N

## SEQUENTIAL TONE SYSTEMS

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| Signal-Digits | (TX - Telegrams) | TON | PRE | DUR | FOL | PRE  | DUR  |
|---------------|------------------|-----|-----|-----|-----|------|------|
| ENC=1         | 2 3 4 5 N        | S   | S   | S   | TTF | 1000 | 1000 |

Example:

ENC=1.2.3.4.5

,TON = S ,PRE = S ,DUR = S  
 ,FOL = STF ,PRE = S ,DUR = S  
 ,FOL = TTF ,PRE = 1000 ,DUR = 1000

The complete telegram:

Syntax: N^STF^TTF^ Default: N

The ,PRE = and ,DUR = subfunction values and their syntax are identical to PRE and DUR described for the main function.

### 8.2.3. SECOND ENCODER

SNC = {telegram digits/N} Default = N

Second encoder telegram and its associated subfunctions are specified as described for ENC = .

The second encoder telegram is, if used, released by pressing the A button and the SKA = criteria is fulfilled.

## SEQUENTIAL TONE SYSTEMS

### 8.2.4. THIRD ENCODER

TNC = {telegram digits/N} Default = N

Third encoder telegram and its associated subfunctions are specified as described for ENC = .

The third encoder telegram is, if used, released by activating an external emergency call button and the TKA = criteria is fulfilled.

### 8.2.5. TRANSMIT ON FIRST PTT

TOF = {telegram digits/N} Default = N

The TOF = telegram and its associated subfunctions are specified as described for ENC = . The telegram is released the first time the PTT button is activated after switching the loudspeaker on and the PTA = criteria is fulfilled.

### 8.2.6. TRANSMIT ON EVERY PTT

TOE = {telegram digits/N} Default = N

The TOE = telegram and its associated subfunctions are specified as described for ENC = . The telegram is released every time the PTT button is activated during a conversation.

### 8.2.7. IDENTIFICATION TIMER

IDT = {N/1...254} Default = N

The identification timer defines the telegram specified by TOE = to be transmitted at regular intervals for identification when the PTT button is being depressed. The time is specified in seconds and legal range is 1-254.

## SEQUENTIAL TONE SYSTEMS

,IDT = N            No identification

,IDT =            value in seconds

Example:            TOE = 1 - 2 - 3 - 4 - 5 ,IDT = 20

CQM6000: Software EF-R5.0    EF Field Programmer.    << Input:    SPS=0 >>

| Signal-Digits   | (TX - Telegrams) | TON | PRE | DUR | FOL | PRE | DUR |
|-----------------|------------------|-----|-----|-----|-----|-----|-----|
| ENC=1 2 3 4 5 N |                  | S   | S   | S   | TTF | S   | S   |
| SNC=5 4 5 6 0 N |                  | S   | S   | S   | TTF | S   | S   |
| TNC=6 0 0 0 N   |                  | S   | S   | S   | TTF | S   | S   |
| TOF=N           |                  |     |     |     |     |     |     |
| TOE=1 2 3 4 5 N |                  | S   | S   | S   | STF | S   | S   |
| ,IDT=20         |                  |     |     |     |     |     |     |

Example:

TOR=1.2.3.4.5 ,TON = S ,PRE = S ,DUR = S  
 ,FOL = STF ,PRE = S ,DUR = S  
 ,IDT = 20

---

Syntax:            1 ..            254, N Default: N

## SEQUENTIAL TONE SYSTEMS

### 8.2.8. ACKNOWLEDGE FOR DECODER

AC1 = {telegram digits/N} Default = N

The AC1 = telegram and its associated subfunctions are specified as described for ENC = .  
The telegram is released when the radio's decoder detects a matching individual call.

### 8.2.9. ACKNOWLEDGE FOR PARALLEL DECODER

AC2 = {telegram digits/N} Default = N

The AC2 = telegram and its associated subfunctions are specified as described for ENC = .  
The telegram is released when the radio's parallel decoder (PDE) detects a matching call.

### 8.2.10. ACKNOWLEDGE FOR CLEAR DOWN DECODER

AC3 = {telegram digits/N} Default = N

The AC3 = telegram and its associated subfunctions are specified as described for ENC = .  
The telegram is released when the radio's clear down decoder detects a matching call.

### 8.2.11. ACKNOWLEDGE TIMER

ACT = {0...2.5} Default = 0.15

The acknowledge timer defines the delay in seconds (0.01 sec. step) from a call has been detected till the corresponding acknowledge telegram is transmitted. Legal range is 0 - 2.5 seconds.

## SEQUENTIAL TONE SYSTEMS

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| Signal-Digits   | (TX - Telegrams) | TON | PRE | DUR | FOL | PRE | DUR |
|-----------------|------------------|-----|-----|-----|-----|-----|-----|
| ENC=1 2 3 4 5 N |                  | S   | S   | S   | TTF | S   | S   |
| SNC=5 4 5 6 0 N |                  | S   | S   | S   | TTF | S   | S   |
| TNC=6 0 0 0 N   |                  | S   | S   | S   | TTF | S   | S   |
| TOE=1 2 3 4 5 N |                  | S   | S   | S   | STF | S   | S   |
| TOF=N           |                  |     |     |     |     |     |     |
| ,IDT=20         |                  |     |     |     |     |     |     |
| AC1=1 2 3 4 5 N |                  | S   | S   | S   | TTF | S   | S   |
| AC2=2 3 4 5 6 N |                  | S   | S   | S   | TTF | S   | S   |
| AC3=5 6 7 8 0 N |                  | S   | S   | S   | TTF | S   | S   |
| ACT= 0.15       |                  |     |     |     |     |     |     |

Syntax:                    0 ..                    2.5    Default: 0.15

### 8.2.12. HANG-UP TELEGRAM

HUT = {telegram digits/N} Default = N

The HUT = telegram and its associated subfunctions are specified as described for ENC = . The telegram is released when the operator terminates a conversation and closes the loudspeaker or places the handset, if used, in the retainer.

## SEQUENTIAL TONE SYSTEMS

### 8.2.12.1. Second telegram format

STF = {telegram digits/N} Default = N

The second telegram format is an auxiliary telegram which can be appended to a functional telegram. The STF telegram is then assigned as FOL = STF to the wanted telegram and may be using its own tone system, preamble and duration specified by its associated ,TON = ,PRE = , and ,DUR = subfunctions.

### 8.2.12.2. Third telegram format

TTF = {telegram digits/N} Default = N

The third telegram format is an auxiliary telegram which can be appended to a functional telegram. The TTF is then assigned as FOL = TTF to the wanted telegram and may be using its own tone system, preamble and duration specified by its associated ,TON = ,PRE = ,DUR = subfunctions.

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| Signal-Digits | (TX - Telegrams) | TON | PRE | DUR  | FOL | PRE | DUR |
|---------------|------------------|-----|-----|------|-----|-----|-----|
| ENC=1         | 2 3 4 5 N        | S   | S   | S    | TTF | S   | S   |
| SNC=5         | 4 5 6 0 N        | S   | S   | S    | TTF | S   | S   |
| TNC=6         | 0 0 0 N          | S   | S   | S    | TTF | S   | S   |
| TOF=N         |                  |     |     |      |     |     |     |
| TOE=1         | 2 3 4 5 N        | S   | S   | S    | STF | S   | S   |
| ,IDT=20       |                  |     |     |      |     |     |     |
| AC1=1         | 2 3 4 5 N        | S   | S   | S    | TTF | S   | S   |
| AC2=2         | 3 4 5 6 N        | S   | S   | S    | TTF | S   | S   |
| AC3=5         | 6 7 8 0 N        | S   | S   | S    | TTF | S   | S   |
| ACT= 0.15     |                  |     |     |      |     |     |     |
| HUT=1         | 2 3 4 5 N        | S   | S   | S    | TTF | S   | S   |
| BYE=N         |                  |     |     |      |     |     |     |
| STF=6         | 1S 2S 0 3 N      | S   | S   | S    |     |     |     |
| TTF=5         | 1A 2A 3A 4A N    | CCI | 200 | 1000 |     |     |     |

ok? (Yes/No/Menu)

## SEQUENTIAL TONE SYSTEMS

Example:

ENC = 1.2.1A.2A.3A, TON = S, PRE = S, DUR = S

,FOL = STF, PRE = S, DUR = S

,FOL = TTF, PRE = S, DUR = S

STF = 8.0.1S.2S.0, TON = S, PRE = S, DUR = S

TTF = 8.0.1A.2A.3A, TON = CCI, PRE = 200, DUR = 1000

Default tone system TON = ZV1

TRANSMITTED TELEGRAM:

### 8.3. SEQUENTIAL TONE DECODER TELEGRAMS

#### 8.3.1. GENERAL DECODER SYSTEM

##### 8.3.1.1. Decoder telegrams

A decoder telegram is a telegram which can be decoded ("understood") by the radio. The CQM6000 EF Software comprises four decoder telegrams:

|       |                              |
|-------|------------------------------|
| DEC = | Ordinary tone decoder        |
| PDE = | Parallel tone decoder        |
| CLD = | Clear down decoder           |
| ADE = | Acknowledge telegram decoder |

## SEQUENTIAL TONE SYSTEMS

### 8.3.1.2. Decoder and display reference digits

Display reference digits must only be used if SPS = 0.

A decoder will always read a reference digit as:

"Write the value in the display."

Example:

You have written: SDE = 1A.2A.3A.1S.2S in the software specification and the second telegram received is 1.3.5.7.9. The queue display will then be as shown here:

Queue number

Reference:

1A 2A 3A

1S 2S

### 8.3.1.3. Don't-care-digits in decoders

If a certain position in a received telegram is not going to be used, you can write X in this position when defining the decoder. The decoder will then "close the switch" provided that the tone frequency and the duration is as specified in the tone system.

Example: DEC = 2.4.X.8.0

The radio will then open upon receiving 2.4.0.8.0 or 2.4.1.8.0 or 2.4.2.8.0 etc.

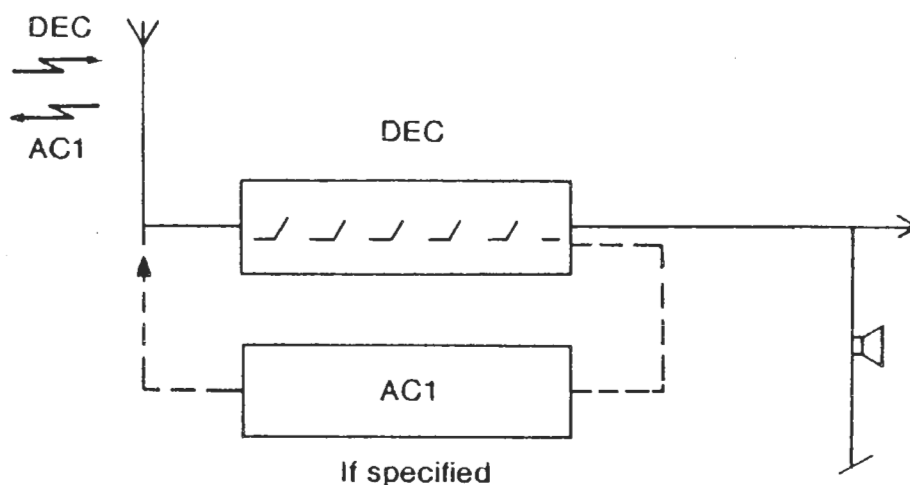

## SEQUENTIAL TONE SYSTEMS

### 8.3.2 DECODER DATA INPUT

#### 8.3.2.1. Decoder

DEC = {telegram digits/N} Default = N

The DEC is the mobile radio's identity in the system; i.e. the "telephone number" of the radio as seen from the system's point of view. (But not necessarily from the users' point of view). The acknowledge for DEC is the AC1 telegrams.

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

Signal-Digits (RX - Telegrams)

FOL

DEC=8    3   4   5   6   N    <Enter>

<Enter>    SDE    ↑

Example:

DEC=8.3.X.2.3    ,FOL = SDE {optional}    ,FOL = SDE/N}

-----  
Syntax: N^SDE^ Default: N

## SEQUENTIAL TONE SYSTEMS

DEC = N No decoder

DEC = {telegram digits}

Fixed tone digits

0 - 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 - A - B - C - D - E

Reference to address digits

x A X = address digit in the display (1-7)

Reference to status digits

x S X = status digit in the display (1-2)

Reference to code plug digits

C x X = code plug digit (1-28)

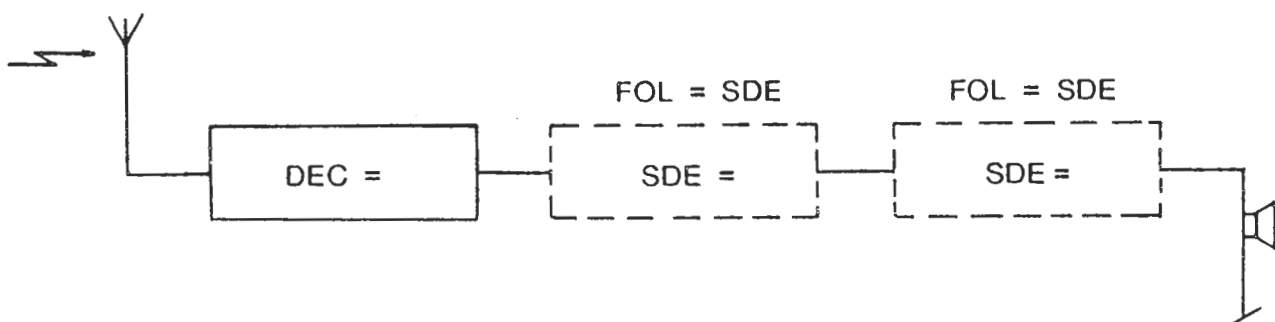

Reference to identification digits

x D X = ID-digit

### 8.3.2.2. Decoder follow telegram

,FOL = {SDE/N} ,FOL = {SDE/N}

The decoder may be followed by a serial decoder SDE which may be specified by entering SDE in the FOL field. If FOL = SDE then the cursor again is placed in the FOL field for a second follow decoder which may be selected by entering SDE.

## SEQUENTIAL TONE SYSTEMS

Note:

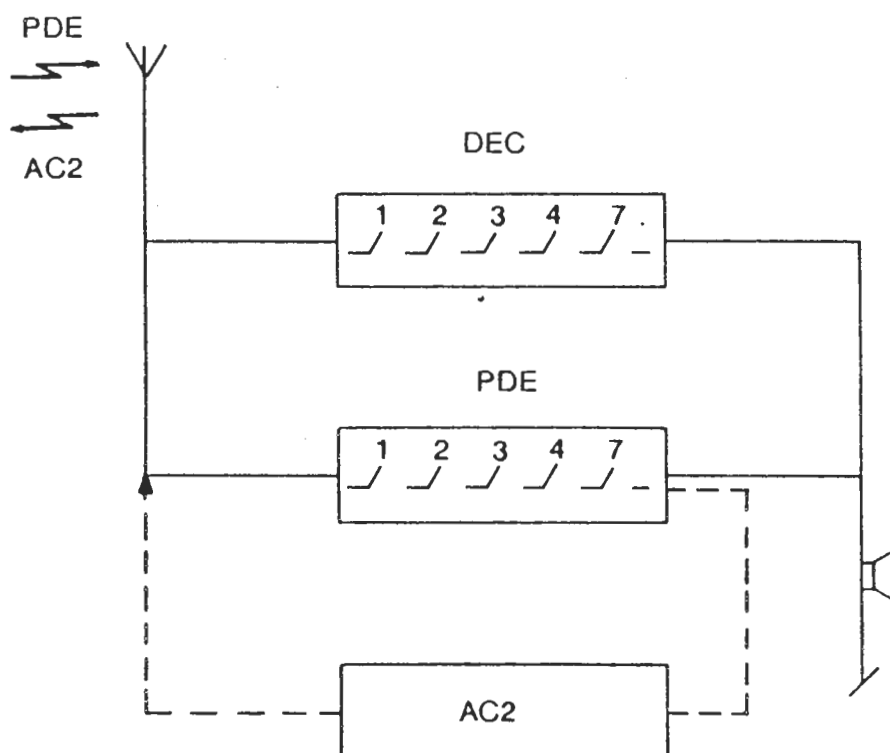

If FOL = SDE then SDE = MUST be defined or an error will occur during calculation of prom data.

### 8.3.3. PARALLEL DECODER

PDE = {telegram digits/N} Default = N

The PDE is an alternative decoder (placed in parallel to the normal decoder, DEC) which makes it possible for the mobile station to have an additional identity, e.g. in the codeplug.

The acknowledge for PDE is the AC2 telegram.

The PDE = telegram digits and its associated subfunctions.

FOL = are specified as described for the decoder DEC = .

## SEQUENTIAL TONE SYSTEMS

### 8.3.3.1. Silent interrogate

,SIL = {Y/N} Default = N

The ,SIL is a special function which makes it possible for the base station to request a status telegram (AC2) from the mobile station without opening the loudspeaker and initiating the normal alert signal.

If SIL = Y is specified the program requires that AC2 = telegram is also defined. Otherwise the an error occurs during prom data calculation.

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| Signal-Digits | (RX - Telegrams) | FOL |
|---------------|------------------|-----|

## SEQUENTIAL TONE SYSTEMS

### 8.3.4. CLEAR DOWN DECODER

CLD = {telegram digits/N} Default = N

The CLD is a special decoder which is used in systems where you want active clear-down of a conversation. Acknowledge for CLD is the AC3 telegram.

The CLD = telegram is specified as described for DEC = .

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

SDE

## SEQUENTIAL TONE SYSTEMS

### 8.3.5. ACKNOWLEDGE DECODER

ADE = {telegram digits/N} Default = N

ADE is decoder which becomes alive upon transmitting a telegram requesting an acknowledgement specified under ,ACE. If an acknowledgement is not received within the limit assigned to ,RTI the requesting telegram will be retransmitted. This cycle will repeat itself until either an acknowledgement is received or the number of cycles becomes equal to the value assigned to ,REP.

When ADE is specified, the loudspeaker will first open upon reception of the telegram specified under ADE.

The ADE = telegram is specified as described for DEC = .

When ADE = is used ACE = , RTI = and REP = must be defined.

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

---

## SEQUENTIAL TONE SYSTEMS

### 8.3.5.1. Acknowledge expected selector

,ACE = {1/2/3/4/5/6/N} Default = N

The ,ACE = subfunction defines on which telegram(s) the acknowledge decoder should be active and expect an acknowledge telegram to be returned by the called station.

The program accept that one or several encoder telegrams are specified.

|         |                                    |                |
|---------|------------------------------------|----------------|
| ACE = 1 | Acknowledge expected on            | ENC = telegram |
| ACE = 2 | Acknowledge expected on            | SNC = telegram |
| ACE = 3 | Acknowledge expected on            | TNC = telegram |
| ACE = 4 | Acknowledge expected on            | TOF = telegram |
| ACE = 5 | Acknowledge expected on            | TOE = telegram |
| ACE = 6 | Acknowledge expected on            | HUT = telegram |
| ACE = N | Acknowledge not expected (ADE = N) |                |

Example: Acknowledge telegram expected upon transmission of ENC, SNC and HUT.

Input: ,ACE = 126

Note: All telegram to which the ACE is referring must be defined using the appropriate function.

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

| ,SIL=N        |                  |     |
| CLD=5         | 5 9 0 0 N        | N   |
| ADE=5         | 4 3 0 1 N        | N   |
| ,ACE=126      |                  |     |

## SEQUENTIAL TONE SYSTEMS

### 8.3.5.2. Repetitions

,REP = {0 - 15} Default = 0

The REP = subfunction defines the number of retry transmission of the telegram(s) which has been defined under ACE = . The radio always transmits the telegram once and then, if no acknowledge is received, retries at intervals defined by RTI = until acknowledge is either received or the number as defined by REP is reached.

### 8.3.5.3. Repetition time

,RTI = {0 - 25.4} Default = 1

The RTI = subfunctions defines the interval between retry transmissions as defined by REP.

The time is specified in seconds, legal range being 0 - 25.4 seconds in 0.1 sec. steps. The minimum time that can be specified must be at least PRE + DUR + length of the expected telegram to be received.

Example: The radio which should acknowledge a transmitted telegram by transmitting an acknowledge signal has been

coded:           PRE = 7 ms DUR = 70 ms  
                  Tone telegram 5 tones each 70 ms

Minimum:        RTI = 70 + 70 + (5 x 70) = 490 ms  
                  ,RTI = 0,5 - 25.4 (seconds)

## SEQUENTIAL TONE SYSTEMS

| ,REP=5        |                  |     |
| ,RTI=1.0      |                  |     |

Syntax:                    0 ..                    25,                    Default: 1

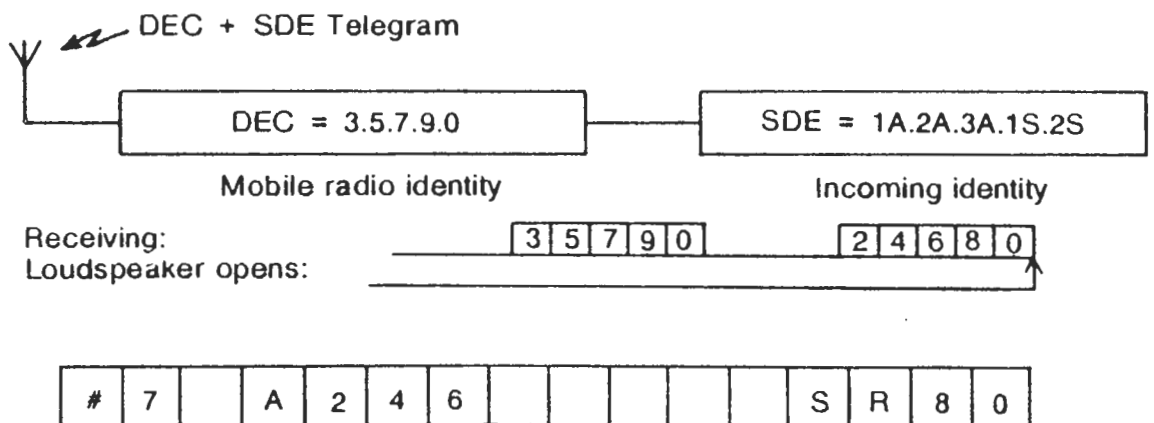

### 8.3.5.4. Serial decoder

SDE = {telegram digits/N} Default = N

The auxiliary decoder telegram is specified by function SDE. It must always be appended to a decoder telegram. (.FOL = .SDE).

Normally it is used for queue handling as shown in the following example:

DEC + SDE telegram

SEQUENTIAL TONE SYSTEMS

Ordered as:

```

DEC      = 3.5.7.9.0
      ,FOL = SDE
      :
      :
SDE      = 1A.2A.3A.1S.2S
    
```

## 9. BINARY SIGNALLING - ZVEI AND EEA

The circuit which takes care of binary signalling is an integrated part of the Stornophone 6000. Accordingly, no supplementary hardware modules have to be ordered, and all information concerning the signalling set-up can be stated using the software nomenclature.

Below, the software input is described when specifying the binary ZVEI and EEA signalling set-up of the Stornophone 6000.

The binary signalling system according to ZVEI is assigned by writing:

**TON = BZV**

Writing: ,BAS = Y will enable the radio to function as a base station.

The binary signalling system according to EEA is assigned by writing:

**TON = BEE**

### 9.1. BINARY TELEGRAMS

The binary systems differ from sequential tone systems by using only two frequencies, representing the binary digits 0 and 1. The advantage is that binary signalling is 10 times faster than sequential tone signalling.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.1.1. THE BINARY ZVEI TELEGRAM

A binary ZVEI telegram consists of a string of bits (bit = binary digit), typically 71 bits long. The telegram is divided into five blocks: the Header, the Preamble, the Block Synchronization, the Message, and the Error Check, see ill. 1.

ill. 1: Structure of ZVEI Binary Telegram.

The Preamble, the Synchronization block, and the Error check are fixed bit patterns and cannot be accessed from the nomenclature. Note that the Preamble of binary ZVEI telegrams has nothing to do with the preamble used in sequential tone signalling.

#### 9.1.1.1. The ZVEI header block

The transmission of a binary ZVEI telegram starts with a header, which is an unmodulated carrier gradually changing into a pattern of alternating "0"s and "1"s. The header lasts for a period of not less than 25 ms, and the alternating bit string lasts for a period not less than 5.8 ms. If desired, the length of the header can be increased by appending a number of extra alternating bits.

Writing, for example, ,PRE = 2 will add two extra bits at the end, making the total length of the header 26.6 ms.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.1.1.2. The ZVEI message block

This block contains the "real" information (the message) conveyed by the telegram. This information is represented in the software nomenclature as a string of **exactly 8** digits, separated by ENTER, where each digit is either a fixed digit or a reference digit. Each position has a fixed meaning according to the ZVEI recommendation, see ill. 2.

ill. 2: The Message Block.

Description of the ZVEI message block continues in Section 9.2.

### 9.1.2. THE BINARY EEA TELEGRAM

A binary EEA telegram consists of a string of bits (bit = binary digit), 96 bits long. The telegram is divided into four blocks: The Preamble, the Block Synchronization, the Message, and the Error Check, see ill. 3.

ill. 3: Structure of EEA Binary Telegram

The Block Synchronization and the Error check are fixed bit patterns and cannot be accessed from the nomenclature.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.1.2.1. The EEA preamble

The transmission of a binary EEA telegram starts with a preamble, which is a string of alternating "0"'s and "1"'s, 16 bits long.

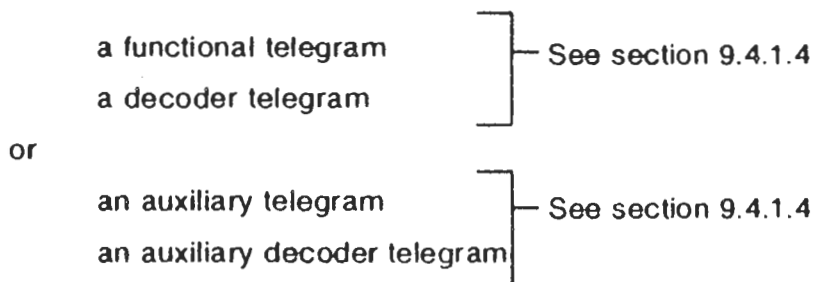

If desired, the length of the Preamble can be increased by appending a number of extra alternating bits.

Writing, for example, ,PRE = 2 will add two extra bits at the end, making the total length of the Preamble 18 bits.

### 9.1.2.2. The EEA message block

This block contains the "real" information (the message) conveyed by the telegram. This information is represented in the software nomenclature as a string of **exactly** 12 positions, separated by  , where each position contains either a fixed digit or a reference digit.

Each position has a fixed meaning according to **whether** the telegram is:

Description of the EEA message block continues in Section 9.4.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2. THE BINARY ZVEI TELEGRAM MESSAGE BLOCK

#### 9.2.1. POSITIONS

##### 9.2.1.1. Position 1: Bak code

The so-called BAK code is a tag which indicates the current function of the telegram. Since the current function of the remaining telegram depends on the current context in which the remaining telegram is used, we write the capital letter "Z" in the first position, that is

ENC = Z. 

A "Z" in the first position will instruct the radio to evaluate the current function of a telegram automatically and insert the correct BAK code. For the sake of completeness, we have shown the various BAK codes in the table below.

| BAK Code | Telegram type      | Remarks |
|----------|--------------------|---------|
| 0        | At free disposal   |         |
| 1        | Call to Mobile     | *)      |
| 2        | Call to Base       | *)      |
| 3        | Identification     |         |
| 4        | Acknowledge        |         |
| 5        | Following Telegram |         |
| 6        | Disconnect Command | *)      |
| 7        | Reserved           |         |
| 8        | Priority Call      | *)      |
| 9        | Status Request     | *)      |
| A        | Reserved           |         |
| B        | Reserved           |         |
| C        | Reserved           |         |
| D        | At free disposal   |         |
| E        | At free disposal   |         |
| F        | Emergency Call     |         |

\*) Acknowledge required

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.1.2. Position 2: Status

The element in position 2 can be assigned as

- either a fixed digit:  
0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/F/X where "X" is the Don't-care-digit.
- or a reference to a digit in the status field in the display (ill. 4):  
1S/2S.

Reference:

1S 2S

ill. 4: Reference digits in status field.

- or a reference to a digit in the codeplug:  
C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14 C15 C16  
C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Examples:

ENC = Z.1. . . . .

ENC = Z.X. . . . .

ENC = Z.2S. . . . .

ENC = Z.C07. . . . .

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.1.3. Position 3: Area code

The Area Code is used to indicate the geographical location of the base station. The position contains one of the values:

0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/F

Example:

ENC = Z.2S.9. . . . .

### 9.2.1.4. Position 4 and 5: Manufacturer code

These positions are used to indicate the manufacturer's identity. The code is prescribed by the national electronics industries association, e.g.:

ENC = Z.2S.9.8.8. . . . .

### 9.2.1.5. Position 6, 7, and 8: Calling number

The calling number occupies exactly three positions where each position contains:

either a fixed digit, that is, 0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/X where "X" is the Don't-care-digit.

or a reference to a digit in the address field in the display (ill. 5):  
1A/2A/3A/4A/5A/6A/7A,

ill. 5: Reference digits in address field

## BINARY SIGNALLING - ZVEI AND EEA

or a reference to a digit in the codeplug:

C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14 C15 C16  
C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Examples:

ENC = Z.2S.9.8.8.1.2.3

ENC = Z.2S.9.8.8.X.2.3

ENC = Z.2S.9.8.8.1A.2A.3A

ENC = Z.2S.9.8.8.C01.C02.1A

### 9.2.2. REFERENCE DIGITS

#### 9.2.2.1. Codeplug reference digits

A codeplug reference digit is a pointer to a digit located in the codeplug. The codeplug may contain up to 28 digits denoted C01 to C28 in the nomenclature.

Example:

|           |                             |
|-----------|-----------------------------|
| Radio:    | DEC = Z.X.9.8.8.C01.C02.C03 |
| Codeplug: | C01 = 1                     |
|           | C02 = 2                     |
|           | C03 = 3                     |

When the codeplug is inserted in the radio, the decoder code will be:

Z.X.9.8.8.1.2.3

## BINARY SIGNALLING - ZVEI AND EEA

Example:

You have written :

DEC = Z.1S 9.8.8.1.2.8  
FOL = SDE  
SDE = Z.2S.9.8.8.1A.2A.3A

in the software specification and the 2 telegrams received are:

The queue display will then be as shown on the previous page (decoding).

### 9.2.2.3. Don't-care-digits

If a certain position in a telegram is not going to be used, you can write X in this position when defining the telegram. The decoders will then "close the switch" and encoders will transmit four logical zeros. See the table at the end of this section.

### 9.2.3. TELEGRAM TYPES

The CQM6000 EF Software contains four System Personality Set-up's (SPS) each with up to 16 telegrams which fall into four categories:

- Functional telegrams (9)
- Decoder telegrams (4)
- Auxiliary telegrams (2)
- Auxiliary decoder telegrams (1)

Please note that the total number of telegrams in all SPS's must not exceed 25!

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.3.1. Functional telegrams

The CQM6000 EF Software includes nine functional encoder telegrams. Such a telegram is transmitted after one of the following actions or events:

| Action/event:  | Telegram: |
|--|-----------|
| Pushing the  button | ENC       |
| Pushing the  button | SNC       |
| Pushing the external emergency button  | TNC       |
| Pushing the PTT button with loudspeaker off  | TOF       |
| Pushing the PTT button   | TOE       |
| Decoding DEC   | AC1       |
| Decoding PDE   | AC2       |
| Decoding CLD   | AC3       |
| Placing the handset in the cradle or closing the loudspeaker manually                                | HUT       |

#### 9.2.3.1.1. Third encoder (TNC) - Emergency procedure

The third encoder telegram is released from the 25 pin connector on the rear side of the radio. When it is released, the emergency procedure is carried out according to the ZVEI recommendation.

#### 9.2.3.2. Decoder telegrams

A decoder telegram is a telegram which can be decoded ("understood") by the radio. The CQM 6000 EF Software comprises four decoder telegrams:

DEC - PDE - CLD - ADE

## BINARY SIGNALLING - ZVEI AND EEA

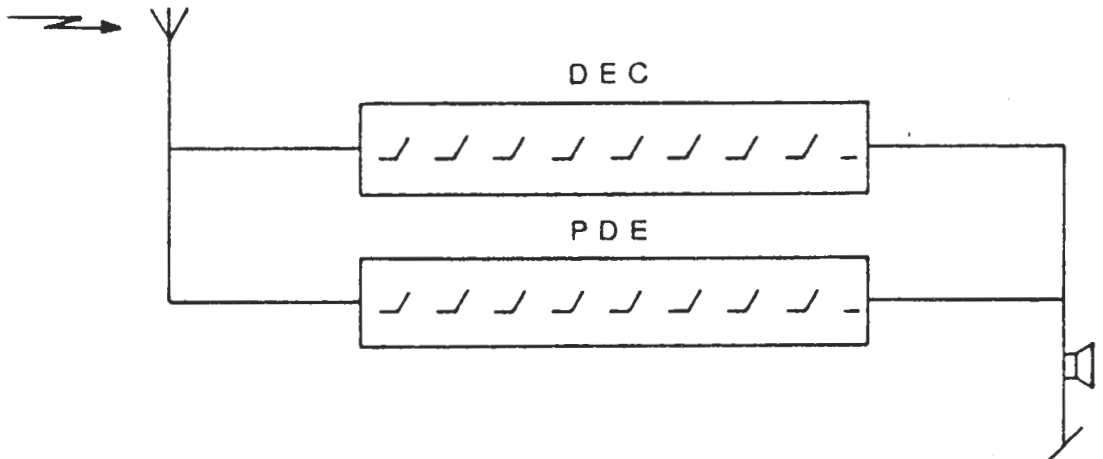

### 9.2.3.2.1. Decoder (DEC)

The DEC is the mobile radio's identity in the system; i.e the "telephone number" of the radio as seen from the system's point of view. (But not necessarily from the users' points of view). The acknowledge for DEC is the AC1 telegram.

### 9.2.3.2.2. Parallel decoder (PDE)

The PDE is an alternative decoder (placed in parallel to the normal decoder, DEC) which makes it possible for the radio to have an additional identity, e.g. in the codeplug. The acknowledge for PDE is the AC2 telegram.

## BINARY SIGNALLING - ZVEI AND EEA

### Silent interrogate (,SIL)

The ,SIL is a special function which makes it possible for the base station to request a status telegram (AC2) from the mobile station without opening the loudspeaker and initiating the normal alert signal.

### 9.2.3.2.3. Clear-down decoder (CLD)

The CLD is a special decoder which is used in systems where you want active clear-down of a conversation. Acknowledge for CLD is the AC3 telegram.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.3.2.4. Acknowledge decoder (ADE)

ADE is a decoder which becomes active upon transmitting a telegram requesting an acknowledgement. Specified under ,ACE. If an acknowledgement is not received within the limit assigned to ,RTI the requesting telegram will be retransmitted. This cycle will repeat itself until either an acknowledgement is received or the number of cycles becomes equal to the value assigned to ,REP.

When ADE is specified, the loudspeaker will first open upon reception of the telegram specified under ADE.

### 9.2.3.3. Auxiliary telegrams

Auxiliary telegrams are telegrams which can be appended to a functional telegram. Note that auxiliary telegrams cannot 'leave the house unless accompanied by a parent", i.e. a functional telegram.

Two telegrams, denoted by the identifiers STF and TTF are available.

Example: Consider the telegram sequence below.

This sequence is assigned when writing:

|      |   |                 |
|------|---|-----------------|
| ENC  | = | Z.7.9.8.8.1.2.8 |
| ,FOL | = | STF             |
|      | : |                 |
|      | : |                 |
| STF  | = | Z.9.9.8.8.1.3.5 |

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.3.4. Auxiliary decoder telegrams

The auxiliary decoder telegram is denoted by the identifier SDE. It must always be appended to a decoder telegram.

Normally it is used for queue handling as shown in the following example:

Receiving:

The display will then show:

Ordered as:

|      |   |                     |
|------|---|---------------------|
| DEC  | = | Z.1S.9.8.8.1.2.8    |
| .FOL | = | SDE                 |
|      | : |                     |
|      | : |                     |
| SDE  | = | Z.2S.9.8.8.1A.2A.3A |

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.4. GROUP CALLS

When designing a group call scheme for the system, you start by assigning the group digit "F" to GRP.

$$\text{GRP} = \text{F}$$

The group digit is used both for decoding and encoding group calls.

Next, you decide which position in the decoder telegram the group tone is to be assigned to. There are precisely three possible ways in which a group call set-up can be made.

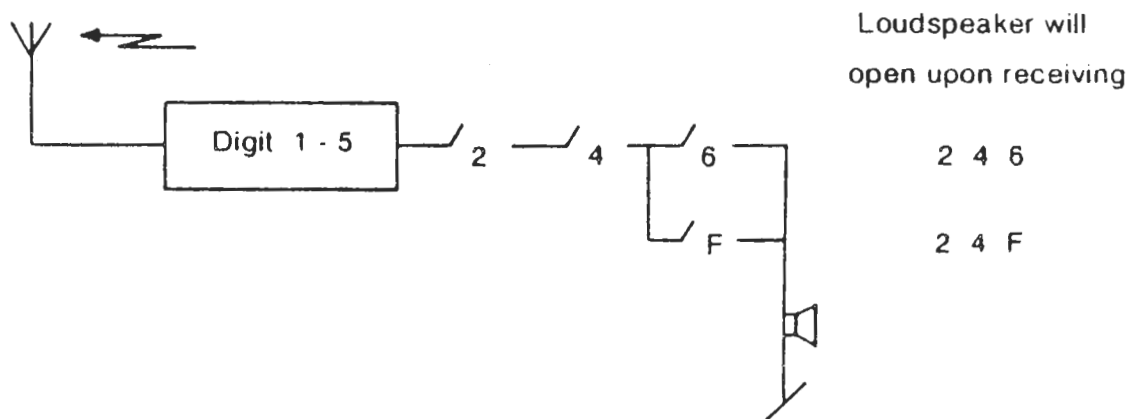

See the examples given on the next page.

#### Example 1, Ten Group

If we write

$$\begin{array}{rcl} \text{GRP} & = & \text{F} \\ \text{,POS} & = & 8 \\ & : & \\ & : & \\ \text{DEC} & = & \text{Z.X.9.8.8.2.4.6} \end{array}$$

we get the set-up in ill. 6 below.

ill. 6: Ten Group.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.2.5. ZVEI BINARY CODE TABLE

| DIGIT | TRANSMITTED AS | REMARKS       |
|-------|----------------|---------------|
| 0     | 0000           | Normal digit  |
| 1     | 0001           | Normal digit  |
| 2     | 0010           | Normal digit  |
| 3     | 0011           | Normal digit  |
| 4     | 0100           | Normal digit  |
| 5     | 0101           | Normal digit  |
| 6     | 0110           | Normal digit  |
| 7     | 0111           | Normal digit  |
| 8     | 1000           | Normal digit  |
| 9     | 1001           | Normal digit  |
| A     | 1010           | Special digit |
| B     | 1011           | Special digit |
| C     | 1100           | Special digit |
| D     | 1101           | Special digit |
| E     | 1110           | Special digit |
| F     | 1111           | Group digit   |
| X     | 0000           | Don't care    |

|               |        |
|---------------|--------|
| Digit length: | 4 bits |
| Preamble:     | 9 bits |

|            |         |
|------------|---------|
| Logical 1: | 1200 Hz |
| Logical 0: | 1800 Hz |

## BINARY SIGNALLING - ZVEI AND EEA

### 9.3. ZVEI BINARY TELEGRAM INPUTS

#### 9.3.1. GENERAL INPUTS (SPS = 0)

##### 9.3.1.1. Tone system

|      |         |                                |
|------|---------|--------------------------------|
| TON  | = BZV   |                                |
| ,PRE | = {S/2} | Default = S                    |
| ,DUR | = S     | Always S for binary signalling |
| ,BAS | = {Y/N} | Base station (Y)es or (N)o.    |

##### 9.3.1.2. Group digit

|      |               |   |
|------|---------------|---|
| GRP  | = F           | Default = F (always F)                                    |
| ,POS | = {6 .. 8}    | Group tone position 6/7/8 or any combination.             |
| ,BDT | = {N/0 - 254} | Group break down timer in seconds.<br>N = Timer disabled. |

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

---

## BINARY SIGNALLING - ZVEI AND EEA

### 9.3.2 ENCODER TELEGRAM DATA INPUTS

#### 9.3.2.1. Encoder telegram

ENC = {telegram digits/N}                      Default = N

The ENC telegram must always consist of 8 digits, the first being entered as ENC = Z . . . . . and ended by inputting N.

The encoder may be followed by STF = and TTF = .

CQM6000: Software EF-R5.0    EF Field Programmer.    << Input:    SPS=0 >>

---

| Signal-Digits | (TX - Telegrams)    | TON PRE | DUR | FOL PRE | DUR     |
|---------------|---------------------|---------|-----|---------|---------|
| ENC=Z         | 2S 9 8 8 C1 C2 1A N | S       | S   | S       | STF S S |

---

Syntax:                      10 ..                      2540, S^N^    Default: S

#### 9.3.2.2. Second encoder

SNC = {telegram digits/N}                      Default = N

#### 9.3.2.3. Third encoder

TNC = {telegram digits/N}                      Default = N

See ENC = .

BINARY SIGNALLING - ZVEI AND EEA

9.3.2.4. Transmit on first PTT

TOF = {telegram digits/N}                      Default = N

9.3.2.5. Transmit on every PTT

TOE = {telegram digits/N}                      Default = N

Specified as described for binary ENC =

9.3.2.6. Identification timer

IDT = {1 - 254/N}                                  Default = N

IDT = (time in seconds) defines the telegram specified by TOE = to be transmitted at regular intervals for identification as long as the PTT button is depressed. If not used then IDT = N.

CQM6000: Software EF-R5.0      EF Field Programmer.    << Input:    SPS=0 >>

#### 9.3.2.7.1. Acknowledge timer

,ACT = {0 - 2.5}                                      Default = 0.15

The acknowledge timer defines the delay in seconds (0.01 sec. steps) from a call has been detected till the corresponding acknowledge telegram is transmitted.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.3.2.8. Hang-up telegram

HUT = {telegram digits/N}                      Default = N

The telegram is specified as described for ENC = and released when the operator terminates a conversation either by closing the loudspeaker or, if used, places the handset in the retainer.

CQM6000: Software EF-R5.0      EF Field Programmer.    << Input:    SPS=0 >>

---

ok?    (Yes/No/Menu)

The functional decoders are all specified by entering 8 telegram digits of which the first must be "Z" and ended by entering "N".

The decoders may be followed by a serial decoder SDE by writing FOL = SDE and defining SDE = {telegram digits}.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.3.3.4.3. Repetitions

,REP = {0 - 15}

Default = 0

The REP= subfunction defines the number of retry transmission of the telegram(s) which has been defined under ACE = . The radio always transmits the telegram once and then, if no acknowledge is received, retries at intervals defined by RTI= until acknowledge is either received or the number as defined by REP is reached.

### 9.3.3.4.4. Repetition time

,RTI = {0-25.4}

Default = 1

The RTI= subfunction defines the interval between retry transmissions as defined by REP.

The time is specified in seconds, legal range being 0 - 25.4 seconds in 0.1 sec. steps. The minimum time that can be specified must be at least PRE + DUR + length of the expected telegram to be received.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.4. THE BINARY EEA TELEGRAM MESSAGE BLOCK

#### 9.4.1. FUNCTIONAL ENCODER AND DECODER TELEGRAMS

For telegrams belonging to these categories, the 12 positions have the following interpretation, see ill. 9 below.

ill. 9: The Message Block

##### 9.4.1.1. Position 1 and 2 : User identity

Position 1 contains one of the values

8/9/A/B/C/D/E/F

while position 2 contains one of the values

0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/F

Example:

ENC = 9.1.

**BINARY SIGNALLING - ZVEI AND EEA**

**9.4.1.2. Position 3, 4, and 5: Address (to)**

These positions are used to indicate the identity of the receiving party. Each position can be occupied by:

- either a fixed digit, that is,  
0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/X  
where "X" is the Don't care digit.
- or a reference to the a digit in the address field in  
the display (ill. 10):  
1A/2A/3A/4A/5A/6A/7A,

**ill. 10: Reference digits in address field**

- or a reference to a digit in the codeplug:  
C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14 C15 C16  
C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Examples:

- ENC = 9.1.2.4.6. . . . .
- DEC = 9.1.2.4.X. . . . .
- ENC = 9.1.1A.2A.3A. . . . .
- DEC = 9.1.C01.C02.C03. . . . .

## BINARY SIGNALLING - ZVEI AND EEA

### 9.4.1.3. Position 6, 7, and 8: Addressor (from)

These positions are used to indicate the identity of the radio as seen from the system point of view (not necessarily the user's point of view). Each position contains:

either a fixed digit, that is

0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/X

where "X" is the Don't-care-digit.

or a reference to a digit in the codeplug:

C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14 C15 C16  
C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Examples:

ENC = 9.1.2.4.6.1.2.3. . . . .

DEC = 9.1.C01.C02.C03.1A.2A.3A. . . . .

ENC = 9.1.1A.2A.3A.C01.C02.C03. . . . .

### 9.4.1.4. Position 9, 10, 11, 12: Data

These positions are used to convey more information. Each position can be occupied by:

either a fixed digit, that is

0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/F/X

where "X" is the Don't-care-digit

or a reference to a digit in the address field or status field in the display, that is,

1A/2A/3A/4A/5A/6A/7A/1S/2S. See ill. 11

## BINARY SIGNALLING - ZVEI AND EEA

Encoding:

Decoding:

### iii. 11: Display reference digits

or a reference to a digit in the codeplug:

C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14 C15 C16  
C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Examples:

ENC = 9.1.2.4.6.1.2.3.X.2.3.4

ENC = 9.1.1A.2A.3A.2.4.6.4A.5A.C01.X

DEC = 9.1.2.4.6.1A.2A.3A.4A.5A.1S.2S.

### 9.4.2. AUXILIARY TELEGRAMS AND AUXILIARY DECODERS

For telegrams and decoders belonging to these categories, the 12 positions have no interpretation; they are all used for additional data.

## BINARY SIGNALLING - ZVEI AND EEA

### 9.4.2.1. Position 1

The range of digit values which can be put into position 1 is restricted to:

0/1/2/3/4/5/6/7

### 9.4.2.2. Positions 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12

Each position can be occupied by

**either** a fixed digit, that is

0/1/2/3/4/5/6/7/8/9/A/B/C/D/E/F/X

where "X" is the Don't-care-digit

**or** a reference to a digit in the address field

or status field in the display, that is,

1A/2A/3A/4A/5A/6A/7A/1S/2S .

**or** a reference to a digit in the codeplug:

C01 C02 C03 C04 C05 C06 C07 C08 C09 C10 C11 C12 C13 C14 C15 C16

C17 C18 C19 C20 C21 C22 C23 C24 C25 C26 C27 C28

Examples:

STF = 0.1.3.5.1A.2A.3A.1S.2S.X.C07.C08

SDE = 0.X.X.X.4A.5A.6A.7A.1S.2S.X.X

## BINARY SIGNALLING - ZVEI AND EEA

### 9.4.3. REFERENCE DIGITS

#### 9.4.3.1. Codeplug reference digits

A codeplug reference digit is a pointer to a digit located in the codeplug. The codeplug may contain up to 28 digits denoted C01 to C28 in the nomenclature.

Example:

|          |                                     |
|----------|-------------------------------------|
| Radio    | DEC = 8.1.C01.C02.C03.X.X.X.X.X.X.X |
| Codeplug | C01 = 1                             |
|          | C02 = 2                             |
|          | C03 = 3                             |

When the codeplug is inserted in the radio, the decoder code will be:

8.1.1.2.3.X.X.X.X.X.X.X

#### 9.4.3.2. Display reference digits

The references indicate the position in the display. The display has two different configurations:

For encoding:

|            |   |   |  |    |    |    |    |    |    |    |   |  |    |    |   |
|------------|---|---|--|----|----|----|----|----|----|----|---|--|----|----|---|
| C          | 1 | 9 |  | A  | 2  | 4  | 6  | 8  | 0  | 1  | 3 |  | S  | 7  | 9 |
| Reference: |   |   |  | 1A | 2A | 3A | 4A | 5A | 6A | 7A |   |  | 1S | 2S |   |

## BINARY SIGNALLING - ZVEI AND EEA

For decoding:

### iii. 12: Display reference digits

#### 9.4.3.2.1. Encoders and display reference digits

An encoder will always read a display reference digit as:

"Take the value in the display" - and then transmit it.

Example:

You have written: ENC = 9.1.1A.2A.3A.1.2.3.1S.2S.4A.5A in the software specification and the display is as shown above (encoding).

The radio will then transmit the telegram corresponding to the string

9.1.2.4.6.1.2.3.7.9.8.0 when the  button is pushed.

#### 9.4.3.2.2. Decoders and display reference digits

Display reference digits must only be used if SPS = 0.

A decoder will always read a reference digit as:

"Write the value in the display."

## BINARY SIGNALLING - ZVEI AND EEA

Example:

You have written :

DEC = 9.1.1.2.3.1A.2A.3A.1S.2S.X.X

in the software specification and the telegram received is:

|     |     |   |   |   |   |   |   |   |   |   |   |   |   |       |     |
|-----|-----|---|---|---|---|---|---|---|---|---|---|---|---|-------|-----|
| PRE | SYN | 9 | 1 | 1 | 2 | 3 | 1 | 3 | 5 | 7 | 9 | X | X | CHECK | SYN |
|-----|-----|---|---|---|---|---|---|---|---|---|---|---|---|-------|-----|

The queue display will then be as shown on the previous page (decoding).

### 9.4.3.3. Don't-care-digits

If a certain position in a telegram is not going to be used, you can write X in this position when defining the telegram. The decoders will then "close the switch" and encoders will transmit four logical zeros. See the table at the end of this appendix.

### 9.4.4. TELEGRAM TYPES

The CQM6000 EF Software contains four System Personality Set-up's (SPS), each with up to 16 telegrams which fall into four categories:

- Functional telegrams (9)
- Decoder telegrams (4)
- Auxiliary telegrams (2)
- Auxiliary decoder telegrams (1)

Please note that the total number of telegrams in all SPS's must not exceed 18!

## BINARY SIGNALLING - ZVEI AND EEA

### 9.4.4.1. Functional telegrams

The CQM6000 EF Software includes nine functional telegrams. Such a telegram is transmitted after one of the following actions or events:

| Action/event:  | Telegram: |
|--|-----------|
| Pushing the  button | ENC       |
| Pushing the  button | SNC       |
| Pushing the external emergency button  | TNC       |
| Pushing the PTT button with loudspeaker off  | TOF       |
| Pushing the PTT button   | TOE       |
| Decoding DEC   | AC1       |
| Decoding PDE   | AC2       |
| Decoding CLD   | AC3       |
| Placing the handset in the cradle or closing the loudspeaker manually                                | HUT       |

#### 9.4.4.1.1. Third encoder (TNC) - Emergency procedure

The third encoder telegram is released from the 25 pin connector on the rear side of the radio. When it is released, the emergency procedure is carried out according to the ZVEI recommendation.

### 9.4.4.2. Decoder telegrams

A decoder telegram is a telegram which can be decoded ("understood") by the radio. The CQM 6000 EF Software comprises four decoder telegrams:

DEC - PDE - CLD - ADE

9.4.4.2.1. Decoder (DEC)

The DEC is the mobile radio's identity in the system; i.e the "telephone number" of the radio as seen from the system's point of view. (But not necessarily from the users' points of view). The acknowledge for DEC is the AC1 telegram.

9.4.4.2.2. Parallel decoder (PDE)

The PDE is an alternative decoder (placed in parallel to the normal decoder, DEC) which makes it possible for the radio to have an additional identity, e.g. in the codeplug.

The acknowledge for PDE is the AC2 telegram.

## BINARY SIGNALLING - ZVEI AND EEA

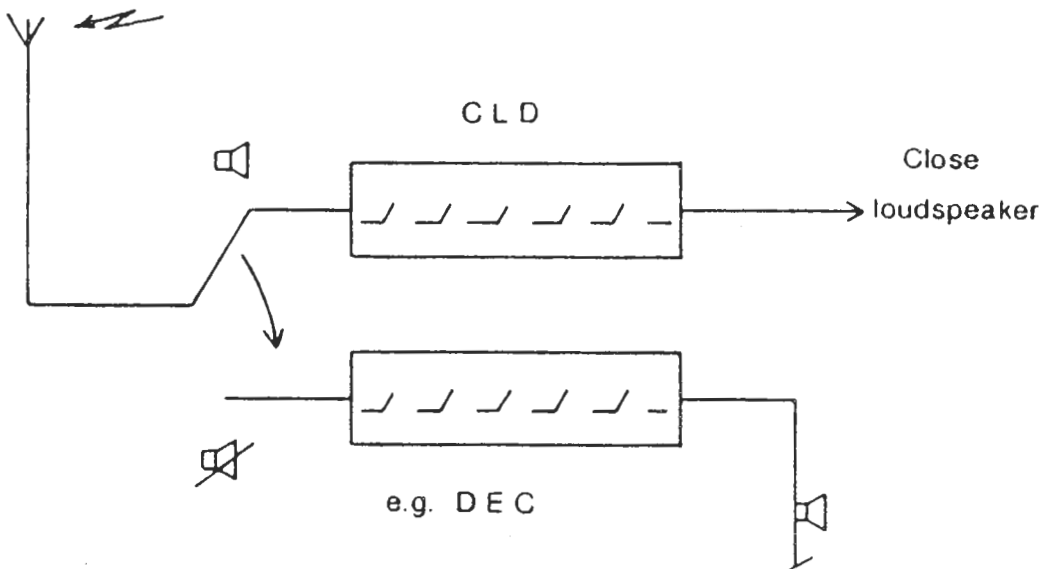

### Silent interrogate (,SIL)

The ,SIL is a special function which makes it possible for the base station to request a status telegram (AC2) from the mobile station without opening the loudspeaker and initiating the normal alert signal.

### 9.4.4.2.3. Clear-down decoder (CLD)

The CLD is a special decoder which is used in systems where you want active clear-down of a conversation. Acknowledge for CLD is the AC3 telegram.

BINARY SIGNALLING - ZVEI AND EEA

9.4.4.4. Auxilliary decoder telegrams

The auxilliary decoder telegram is denoted by the identifier SDE. It must always be appended to a decoder telegram.

Normally it is used for queue handling as shown in the following example:

Receiving:

The display will then show:

Ordered as:

- DEC = 9.1.1.2.3.1A.2A.3A.4A.5A.6A.7A
- ,FOL = SDE
- :
- :
- SDE = 0.1S.2S.X.X.X.X.X.X.X.X

9.4.5. GROUP CALLS

When designing a group call scheme for the system, you start by assigning the group digit "F" to GRP.

$$\text{GRP} = \text{F}$$

The group digit is used both for decoding and encoding group calls.

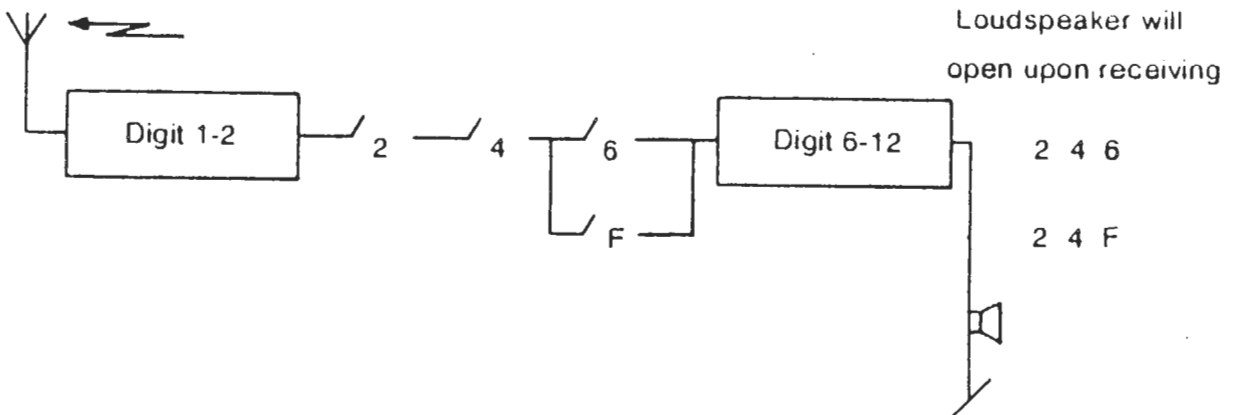

Next, you decide which position in the decoder telegram the group tone is to be assigned to. There are precisely three possible ways in which a group call set-up can be made. See the examples given below.

Example 1, Ten Group

If we write

$$\begin{array}{rcl} \text{GRP} & = & \text{F} \\ \text{,POS} & = & 5 \\ & : & \\ & : & \\ \text{DEC} & = & 9.1.2.4.6.1A.2A.3A.1S.2S.X.X \end{array}$$

we get the set-up in ill. 13 below.

ill. 13: Ten Group.

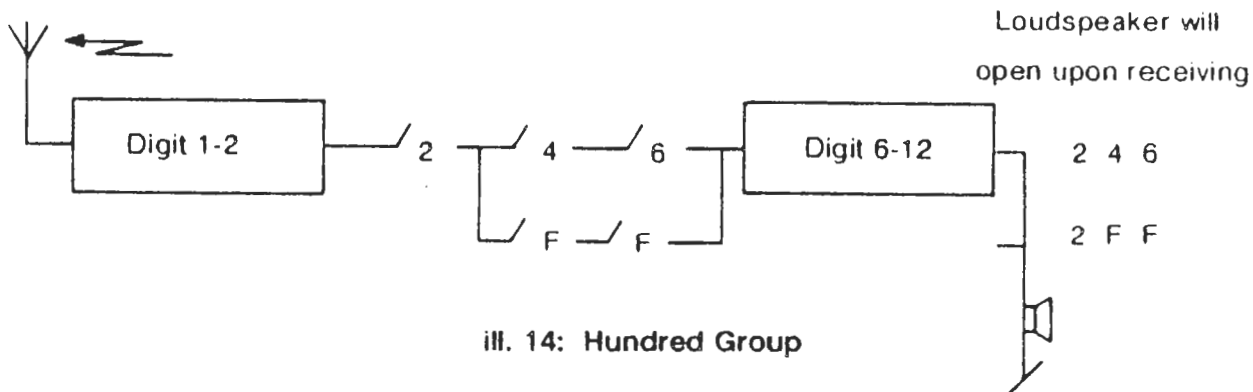

BINARY SIGNALLING - ZVEI AND EEA

Example 2, Hundred Group

If we write

GRP = F  
 ,POS = 4  
 :  
 :  
 DEC = 9.1.2.4.6.1A.2A.3A.1S.2S.X.X

we get the set-up in ill. 14

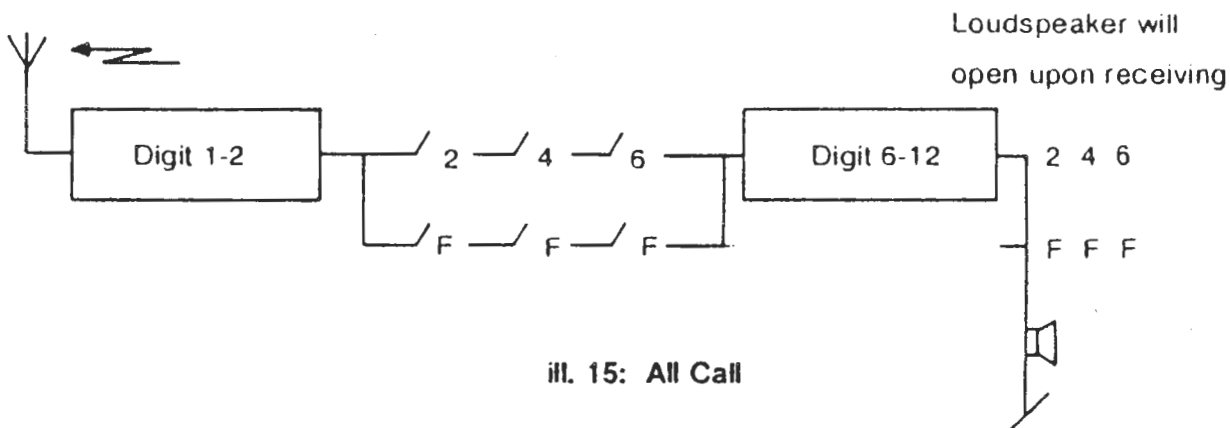

Example 3, All Call

If we write

GRP = F  
 ,POS = 3  
 :  
 :  
 DEC = 9.1.2.4.6.1A.2A.3A.1S.2S.X.X

we get the set-up in ill. 15

**BINARY SIGNALLING - ZVEI AND EEA**

**9.4.6. EEA BINARY CODE TABLE**

| DIGIT | TRANSMITTED AS | REMARKS       |
|-------|----------------|---------------|
| 0     | 0000           | Normal digit  |
| 1     | 0001           | Normal digit  |
| 2     | 0010           | Normal digit  |
| 3     | 0011           | Normal digit  |

## BINARY SIGNALLING - ZVEI AND EEA

### 9.5.2. ENCODER TELEGRAM DATA INPUTS

#### 9.5.2.1. Encoder telegram

ENC = {telegram digits/N} Default = N

The ENC telegram must always consist of 12 digits and ended by inputting N.

The encoder may be followed by STF = and TTF = .

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

---

| Signal-Digits | (TX - Telegrams)               | TON | PRE | DUR | FOL | PRE | DUR |
|---------------|--------------------------------|-----|-----|-----|-----|-----|-----|
| ENC=9         | 1S 1A 2A 3A 2 2 4A 5A C1 1 0 N | S   | S   | S   | TTF | S   | S   |

---

Syntax: 10 .. 2540, S\*N Default: S

#### 9.5.2.2. Second encoder

SNC = {telegram digits/N} Default = N

#### 9.5.2.3. Third encoder

TNC = {telegram digits/N} Default = N

See ENC = .

## EEA BINARY TELEGRAM INPUTS

### 9.5.2.4. Transmit on first PTT

TOF = {telegram digits/N}    Default = N

### 9.5.2.5. Transmit on every PTT

TOE = {telegram digits.N}    Default = N

Specified as described for binary ENC = .

#### 9.5.2.5.1. Identification timer

,IDT = {1 - 254/N}            Default = N

IDT = (time in seconds) defines the telegram specified by TOE = to be transmitted at regular intervals for identification as long as the PTT button is depressed. If not used then IDT = N.

CQM6000: Software EF-R5.0    EF Field Programmer.    << Input:    SPS=0 >>

### 9.5.3. DECODER TELEGRAM DATA INPUTS

#### 9.5.3.1. Decoder

DEC = {telegram digits/N}      Default = N

#### 9.5.3.2. Parallel decoder

PDE = {teleg. digits/N}      Default = N

,SIL = {Y/N}      Default = N

#### 9.5.3.3. Clear down decoder

CLD = {telegram digits/N}      Default = N

## EEA BINARY TELEGRAM INPUTS

### 9.5.3.4. Acknowledge decoder

ADE = {telegram digits/N} Default = N  
 ,ACE = {1/2/3/4/5/6/N} Default = N  
 ,REP = {0 - 15} Default = 0  
 ,RTI = {0 - 25.4} Default = 1

CQM6000: Software EF-R5.0 EF Field Programmer. << Input: SPS=0 >>

---

| Signal-Digits | (RX - Telegrams)            | FOL |
|---------------|-----------------------------|-----|
| DEC=9         | 1 1 2 3 2 1 3 0 0 0 0 1 N   | SDE |
| PDE=9         | 1 1 2 3 2 2 C1 C2 0 0 0 1 N | SDE |
| ,SIL=Y        |                             |     |
| CLD=9         | 1 1 2 3 X X X X X X X N     | N   |
| ADE=9         | 1 1 2 3 5 0 0 2 2 2 2 2 N   | N   |
| ,ACE=145      |                             |     |
| ,REP=3        |                             |     |
| ,RTI=3.0      |                             |     |
| SDE=0         | 1S 2S X X X X X X X X X X N |     |

---

ok? (Yes/No/Menu)

The functional decoders are all specified by entering 12 telegram digits and ended by entering "N".

The decoders may be followed by a serial decoder SDE by writing FOL = SDE and defining SDE = {telegram digits}.

## EEA BINARY TELEGRAM INPUTS

### 9.5.3.4.1. Silent interrogate

.SIL = {Y/N}                      Default = N

The silent interrogate is a special function which makes it possible for the base station to request a status telegram (AC2) be transmitted by the mobile without opening the loudspeaker and sounding the normal alert signal.

If SIL = Y is specified the AC2 = (telegram) must also be defined. Otherwise an error occurs during prom data calculations.

### 9.5.3.4.2. Acknowledge expected selector

.ACE = {1/2/3/4/5/6/N}            Default = N

The .ACE subfunction defines on which telegram(s) the acknowledge decoder should be active and expect an acknowledge telegram to be returned by the called station.

The program accepts that one or several encoder telegrams are specified.

|         |                          |                |
|---------|--------------------------|----------------|
| ACE = 1 | Acknowledge expected on  | ENC = telegram |
| ACE = 2 | Acknowledge expected on  | SNC = telegram |
| ACE = 3 | Acknowledge expected on  | TNC = telegram |
| ACE = 4 | Acknowledge expected on  | TOF = telegram |
| ACE = 5 | Acknowledge expected on  | TOE = telegram |
| ACE = 6 | Acknowledge expected on  | HUT = telegram |
| ACE = N | Acknowledge not expected | (ADE = N)      |

Example:

Acknowledge telegram expected upon transmission of ENC, SNC and HUT:

Input: .ACE = 126

Note:            All telegrams to which the ACE is referring must be defined using the appropriate function.

## EEA BINARY TELEGRAM INPUTS

### 9.5.3.4.3. Repetitions

,REP = {0 - 15}                      Default = 0

The REP= subfunction defines the number of retry transmission of the telegram(s) which has been defined under ACE = . The radio always transmits the telegram once and then, if no acknowledge is received, retries at intervals defined by RTI= until acknowledge is either received or the number as defined by REP is reached.

### 9.5.3.4.4. Repetition time

,RTI = {0-25.4}                      Default = 1

The RTI= subfunction defines the interval between retry transmissions as defined by REP.

The time is specified in seconds legal range being 0 - 25.4 seconds in 0.1 sec. steps. The minimum time that can be specified must be at least PRE + DUR + length of the expected telegram to be received.

# SECTION 10

## MIXED TONE SYSTEMS

|     |                         |   |
|-----|-------------------------|---|
| 10. | MIXED TONE SYSTEMS..... | 2 |
|-----|-------------------------|---|

## 10. MIXED TONE SYSTEMS

The EF Software provides the option of assigning a tone system specific to a functional or an auxiliary telegram by using the telegram's subfunction identifier ,TON .

If you have assigned a default tone system to the main term identifier TON , all telegrams will use the default tone system except for the telegrams which are assigned otherwise by their subfunction identifier ,TON .

Note that the telegram format for every telegram must obey the rules specific to the signalling system chosen for that telegram.

Note also that if you want to change the signalling system for decoder telegrams you must implement an additional SPS.

The total number of telegrams in all SPS's depends on which systems you are mixing.

Example 1:

Suppose that you have chosen ZVEI 1 as the default tone system by writing

TON = ZV1 and that you want the second encoder telegram

SNC = 1.2.3.4.1A.2A to be transmitted in ZVEI 3:

```
TON      = ZV1
          :
          :
SNC      = 1.2.3.4.1A.2A
          ,TON = ZV3
```

## MIXED TONE SYSTEMS

Example 2:

Assume that the unit must have its decoder code in the ZVEI 1 signalling system. Furthermore, we want the ZVEI 1 telegram 2.4.1A.2A.3A to be transmitted when pushing the  button and the Binary ZVEI telegram Z.2S.9.8.8.1.2.3 when pushing the  button.

This set-up is written as

|      |   |                  |
|------|---|------------------|
| TON  | = | ZV1              |
|      | : |                  |
|      | : |                  |
| ENC  | = | 2.4.1A.2A.3A     |
| SNC  | = | Z.2S.9.8.8.1.2.3 |
| ,TON | = | BZV              |

## MIXED TONE SYSTEMS

Example 3.

We want a unit with the Binary ZVEI decoder code Z.2S.9.8.8.4.5.6 . Pushing the  button we want to transmit the Binary ZVEI telegram Z.2S.9.8.8.1.2.3 via a repeater requiring the ZVEI 1 telegram 2.4.6.8.0 in order to open. This is done in the following way:

|      |   |                  |
|------|---|------------------|
| TON  | = | BZV              |
|      | : |                  |
|      | : |                  |
| ENC  | = | 2.4.6.8.0        |
| ,TON | = | ZV1              |
| ,FOL | = | STF              |
|      | : |                  |
|      | : |                  |
| STF  | = | Z.2S.9.8.8.1.2.3 |
|      | : |                  |

| 11.2.   | SAVING PROM DATA.....                  | 3 |

## 11. DATA FILE SAVING AFTER DATA ENTRY

### 11.1. SAVING ORDER DATA

The data input entered by the operator should be saved on the disk when the last SPS = 3 has been finished.

The program prompts:

**Save order data on disk? (Y/N)**

and then if "Y" is pressed,

**write: Name (without .dta) (filename)**

The operator must then enter the filename in which the order data shall be saved.

Pressing  without a filename automatically writes a file named TEMP.DTA

When pressing  the program displays:

**writing Order data < drive:\directory\filename >**

**... and then calculates the personality prom data.**

## DATA FILE SAVING AFTER DATA ENTRY

- CHANNEL GUARD DEFINITION
- BAK/ID/MFG-QC-SERVICE

Save promdata on disk? (Y/N)

### 11.1.1. ERRORS AND WARNINGS

During calculation the program verifies that data are valid and if not displays Error messages and warnings. Depending on the type of warning data may be edited before saving the prom data. Prom data are, however, calculated and may be saved.

If an error message is displayed data must always be corrected and a new calculation performed before saving the data file.

## DATA FILE SAVING AFTER DATA ENTRY

### 11.2. SAVING PROM DATA

When prom data are ready to be saved the program displays:

**Write name? (without .obj) {filename}**

The operator must then enter the filename in which the prom data shall be saved.

Pressing  without a filename automatically writes a file named TEMP.OBJ. When pressing  the program displays:

**Writing < drive:\directory\filename >  
... and returns to the MAIN MENU.**

## SECTION 12

### DISK I/O OPERATIONS

|       |                             |   |
|-------|-----------------------------|---|
| 12.   | DISK I/O OPERATIONS.....    | 1 |
| 12.1. | READ AN ORDER FILE (R)..... | 2 |
| 12.2. | WRITE ORDER DATA (W).....   | 3 |
| 12.3. | GET PROM DATA (G).....      | 3 |
| 12.4. | PUT PROM DATA (P).....      | 4 |

## 12. DISK I/O OPERATIONS

The (D)isk I/O operation is selected from the MAIN MENU and may be used to save and read data files which have been entered (order data file) or calculated (prom data file).

CQM6000: Software EF-R5.0 EF Field Programmer.

---

### MAIN MENU

---

When you are in "(E)nter data" you can call HELP by pressing <F1>.

---

(E)nter data, (D)isk I/O, (L)ists, (C)odeplug, (S)etup, (T)ransfer, (Q)uit ?

Select Disk I/O by pressing (D) and the following prompt displays five options:

---

DISK: (R)ead/(W)rite orderdata, (G)et/(P)ut promdata or (M)enu ?

| Press: | To:                       |
|--------|---------------------------|
| R      | Read an order file        |
| W      | Write order data entered  |
| G      | Get prom data file (read) |
| P      | Put prom data (save)      |
| M      | Return to Main Menu       |

## DISK I/O OPERATIONS

### 12.1. READ AN ORDER FILE (R)

Prompt:

File to be read? (without .dta) {Filename}

Enter without a filename will read the default file TEMP.DTA.

The entered filename must exist on the disk and in the selected directory. Otherwise a - Disk read error - message is displayed.

If this occurs press  and, when the Main Menu is displayed select Setup to change disk drive and/or directory.

If the file exists the program displays a reading message:

Reading <drive:\directory\filename> . . . and then prompts:

Calculate prom? (Y/N)

Press (Y) to calculate the prom data.

While calculating the program displays the calculating procedures being performed and, if an error is found displays either an error message or warning.

Press (N) to return to the Main Menu without calculating prom data.

## DISK I/O OPERATIONS

### 12.2. WRITE ORDER DATA (W)

Prompt:

Save order data on disk? (Y/N)

Press (Y) to proceed or (N) to return to the Main Menu.

Press (Y)

Prompt:

Write: Name? (without .dta) {filename}

Enter without a filename will write the default file TEMP.DTA.

The entered filename must be valid; if not the program displays the error message:

<unable to write order data to disk>.

While writing the file the program displays:

Writing <drive:\directory\filename >

. . . and then returns to the Main Menu.

### 12.3. GET PROM DATA (G)

Prompt:

File to be read? (without .obj) {filename}

Enter without a filename will read the default file TEMP.OBJ

The entered filename must exist on the disk and in the selected directory. Otherwise a - Disk read error - message is displayed.

## DISK I/O OPERATIONS

If this occurs press  and, when the Main Menu is displayed select Setup to change disk drive and/or directory.

If the file exists the program displays a reading message:

Reading < drive:\directory\filename >  
... and then returns to the Main Menu.

### 12.4. PUT PROM DATA (P)

Prompt:

Save prom data on disk? (Y/N)

Press (Y) to proceed or (N) to return to the Main Menu.

Press (Y)

Prompt:

Write: Name? (without .obj) {filename}

The entered filename must be valid; if not the program displays the error message:

<unable to write prom data to disk >

While writing the file the program displays:

Writing: < drive:\directory\filename >.

## SECTION 13

### LISTING A DATA FILE

|       |                             |   |
|-------|-----------------------------|---|
| 13.   | LISTING A DATA FILE.....    | 1 |
| 13.1. | LISTING ON PRINTER (P)..... | 1 |
| 13.2. | LISTING ON SCREEN (S).....  | 4 |

## 13. LISTING A DATA FILE

The Main Menu option (L)ists provides routines for listing the current order and prom file on either a printer or the screen.

When (L)ists is selected the system prompts:

LISTS: on (P)rinter, on (S)creen or (M)enu.

Press (P) for printer

Press (S) for screen

Press (M) to return to the Main Menu.

### 13.1. LISTING ON PRINTER (P)

Note:

This option can only be used if a printer is connected to the computer. The printer MUST be turned on and selected. Otherwise an unrecoverable error may exist and terminate the program.

When the (L)ist (P)rinter is selected the program prompts:

LIST what? (O)rder data, (P)rom data or (M)enu.

LISTING A DATA FILE

Example: (L)ists (P)rinter (O)rder data.

## 14. CODE PLUG PROGRAMMING

The Stornophone 6000 EF personality program can be used to calculate data for code plugs.

This option is selected from the Main Menu, option (C)ode plug and the Code Plug Menu is displayed:

(D)efaults, (E)nter data, (S)store data, (L)oad data or (M)enu.

| Press: | to:                    |
|--------|------------------------|
| D      | Set data to defaults   |
| E      | Enter data             |
| S      | Store data (disk file) |
| L      | Load data (disk file)  |
| M      | Return to Main Menu    |

### 14.1. DEFAULTS (D)

Pressing (D)efaults resets data already being entered to the default values as defined in the code plug nomenclature.

##### 14.2.1.1. Code plug number

CNU = {1 - 9999}

The code plug number must be identical to the code plug number in the radio's personality prom.

## CODE PLUG PROGRAMMING

### 14.2.1.2. Channel guard (CTCSS) decoder

CGD = {Tone number/N}      Default = N

Programming a channel guard decoder tone in the code plug requires that CGD = CS in the radio's personality prom.

### 14.2.1.3. Channel guard (CTCSS) encoder

CGE = {Tone number/N}      Default = N

Programming a channel guard encoder tone in the code plug requires that CGE = CS in the radio's personality prom.

### 14.2.1.4. Code plug released channels

CH1 - CH9 = {Channel number/N}      Default = N

Programming a channel to be released by inserting the code plug requires that the subfunction ,PLG related to CHF = {Channel number} is programmed ,PLG = Y.

### 14.2.1.5. Code plug tone digits

C1 - C28 = {Tone number/N}      Default = N

Maximum 28 tone digits in the tone telegrams may be programmed in the code plug.

Each digit may be part of a telegram or several telegrams and the tone number to be programmed must belong to the tone system used by the telegram.

All tones not used must be programmed Cxx = N.

## CODE PLUG PROGRAMMING

-----  
(E)dit, (C)odeplug-menu or (M)ain-menu

When all data have been entered the contents of the code plug is automatically calculated and displayed. Optionally the data may be edited, (E)dit, or data can be stored if returning to (C)ode plug menu. Pressing (M)ain Menu returns to the Main Menu.

### 14.3. STORE CODE PLUG DATA (S)

Prompt:

Write: Name? (without .plg) {Filename}

Enter without filename automatically writes the file TEMP.PLG.

## CODE PLUG PROGRAMMING

The filename must be legal or the error message:

**Can not write to disk!**

is displayed and pressing a key returns to at the code plug menu.

### 14.4. LOAD DATA (L)

Prompt:

**Read: Name? (without .plg) (Filename)**

Enter without filename automatically reads the default file TEMP.PLG.

If the filename does not exist or is illegal the error prompt:

**- - - wrong filename - - -**

is displayed.

The code plug file may be accessed by a code plug programming device.

# SECTION 15

## TRANSFER DATA

|       |                            |   |
|-------|----------------------------|---|
| 15.   | TRANSFER DATA .....        | 1 |
| 15.1. | TRANSFER TO PATSI (P)..... | 1 |
| 15.2. | TRANSFER TO DATA I/O.....  | 2 |

## 15. TRANSFER DATA

The personality prom file stored in the computer memory may be transferred to a prom programmer or to a Programming and Test Service Instrument (PATSI) using the (T)ransfer routine.

Prompt:

**TRANSFER: (P)atsi, (D)ata io, (M)enu?**

### 15.1. TRANSFER TO PATSI (P)

Prompt:

**Is Control Box installed?**

Press (Y)es if the radio to be programmed has a control box installed; otherwise press (N)o.

While transferring data the computer displays:

**Computer Busy - Wait.**

Note: The personality data must be calculated for a radio with structured option HB (EE prom installed) if the radio is programmed with a PATSI.

## TRANSFER DATA

### 15.2. TRANSFER TO DATA I/O

The personality data may be programmed into an Eprom using a DATA I/O 19 or 22 programmer provided that the data have been calculated for a radio with structured option HA (Eprom to be installed).

When pressing (D)ata I/O the following screen is displayed:

|                         |
|-------------------------|
| DATA OUTPUT TO I/O 19   |
| PRESS            SELECT |
| PRESS            D1     |
| PRESS            START  |
| HIT ANY KEY ON PC       |

|                        |
|------------------------|
| DATA OUTPUT TO I/O 22  |
| PRESS            COPY  |
| PRESS            PORT  |
| PRESS            RAM   |
| PRESS            START |
| HIT ANY KEY ON PC      |

The DATA I/O programmer must be on and setup for remote input via the RS-232 port.
